Editorial

As you may already have noticed elsewhere in this issue, the price of each double-sided Antic Monthly Disk has been

slashed almost in half—from \$10.95 to \$5.95. And the newsstand price of the monthly magazine-plus-disk Action Edition was lowered by three dollars—now \$9.95 instead of \$12.95.

At the same time, we have been forced to raise the North American newsstand price of **Antic** 45 cents in order to bring income more in line with current costs. When you compare a \$3/\$5 disk-price reduction against a 45-cent magazine increase, we think the overall change seems pretty fair.

Also, Antic Publishing is *not* raising any subscription prices at this time. And we presently have *no* plans for any subscription price boosts. This means it's a better deal than ever to subscribe to your favorite Atari magazine—only \$28 for 12 **Antic** issues in the U.S.. And for a short time only, a special offer of \$79.95 for the Action Edition of 12 disk issues.

Our primary purpose in drastically cutting prices of the double-sided Antic Monthly Disk is to make it a lot easier for Atari "power users" to build up a large library of useful and valuable software at a lower cost than ever before possible! This magazine's surveys during the past two years have shown clearly that **Antic** readers now consist almost equally of programming hobbyists, and power users who are not heavily interested in writing their own software.

Typing in magazine listings is an excellent way to learn programming. But it cannot be an especially gratifying experience for people who just want to *use* the software, rather than figuring out exactly how it works. Now for less than \$6 a month, you can get a disk that immediately delivers every program in the issue—plus Xtended Disk Bonus software

that's too big and powerful to be printed as a type-in listing.

The Xtended Disk Bonus is a new feature starting with this issue of **Antic**. Every month we will publish at

least one disk-only program. Whenever possible, this Xtended Bonus will be a listing that is too big or too complicated to have been accepted as a type-in listing. This month's Xtended Bonus is a full-featured 8-bit word processor, written in speedy machine language by professional programmers. Next month, the disk bonus will be a professionally programmed 8-bit database. In future months, there will also be Xtended Disk Bonuses for the ST.

Because readers don't need to type in the Xtended Disk Bonus, we will bring you big, ambitious application software written in any language that has a "stand-alone" option. (Stand-alone programs can be used by readers who don't own the actual language.) In the past, **Antic** has been unable to accept many otherwise excellent programs simply because they were too big to print, too hard to type, or written in a language that most readers couldn't use.

But now the Xtended Disk Bonus feature lets us bring you a new treasure trove of powerful software at unheard-of savings—a double sided disk with close to 176K of Atari programs per month for less than \$6. We can hardly believe it ourselves. . .

By the way, **Antic** would like to thank the thousands of readers who have been voting for their favorite features in recent issues by circling numbers on the monthly reader service card. At this writing, your first ballots are just being tabulated.

Nat Friedland

Nat Friedland
Editor, **Antic**

DESIGNING LABELS

Designer Labels (Antic, April 1987) is an excellent program, but here's my simple fix that will allow readers to use graphics from the *original* Print Shop disk as well as the Print Shop Graphics Library disks:

Boot Print Shop as usual, and enter the Graphic Editor. Then GET any of the 60 designs on the original disk and SAVE the design to a data disk formatted by Print Shop. The saved graphics are now compatible with the Designer Labels program and may be used exactly as you would use graphics from the Library disks. You still can't use images directly from the Print Shop disk itself, but you *can* use the graphics from it once you've followed this procedure.

Robert Conklin
Liverpool, New York

EDU-WARE LIST

I am computer-using educator who has compiled a database of over 350 commercial educational software titles for the 8-bit Atari. In order to keep this database current, I welcome any update information that Antic readers might send me. I am also glad to send a copy of my seven-page, single-spaced list to anyone who sends me a stamped, self-addressed envelope plus 50 cents to cover printing costs.

William Brooks III
Naquag School
Rutland, MA 01543

DVORAK TOOL

The *Dvorak Keyboard* (Antic, March 1987), when combined with the Multi-AUTORUN program from the same issue, can be used with the Writer's Tool word processor from OSS. Format a disk and write the modified DOS from Multi-AUTORUN on the disk. Save the Dvorak file to disk as AUTORUN.SYS, and copy the AUTORUN.SYS file from the Writer's Tool disk, saving it to the new disk as AUTORUN1.SYS. When the program initializes, the Dvorak program operates as advertised. Now—if I can just figure out how to type on my Dvorak keyboard.

Brian Pendergrass
APO, NY

SOUND OFF

Can I permanently modify DOS to disable *all* input/output sounds? I realize that POKE 65,0 turns it off, but pressing [RESET] brings it back.

Arnel Gallanosa

If you are a machine language programmer, you could write a routine to store a zero at location 65 during every vertical blank interrupt, preserve this routine under a new MEMLO, and trap the RESET vector to keep it there. Readers, let us know if there's an easier way to do this.—
ANTIC ED

SILENT TYPEWRITER

We have received a lot of letters and phone calls regarding the Talking Typewriter (Antic, January 1987). Many praised the project and asked us to print the advanced version of it, while others said it didn't work at all. We tested our prototype for an entire month at Antic before printing the article, and we can think of no reason for a properly built board and a properly typed program not to work. Here are some common errors:

- *Some people wired the serial connector backwards. The diagram shows the pins as you look at the computer—that is, from the rear of the plug (as the diagram states).*

- *The .022pF capacitor in Figure 1 should be a .022uF—our mistake.*

- *The notes at the bottom of the parts list on page 23 explain some workable substitutions.—*ANTIC ED

TTY FOR THE DEAF

*Regarding Deaf Modem Help (Antic I/O, April 1987), it has been brought to our attention that that page 69 of the Atari 850 Interface Manual contains a listing for a Baudot terminal emulator. This may be helpful to persons wishing to communicate with their deaf friends via Atari computers and modems.—*ANTIC ED

ATTENTION 8-BIT POWER USERS!

MICROMOD —“TURBOBASE”™—

“The world's most powerful 8-bit database”

UNHEARD OF FEATURES AND CAPACITY ON YOUR 8-BIT! All of the best features, capacity, and speed of the most powerful 16-bit CORPORATE databases—Lotus™, Dbase III™, Dac Easy™, VIP Prof™, PFS File™, etc.—without the BIG BUSINESS garbage you'll never use in your small business, and without 5/6ths of the unnecessary procedure. Exclusive features you've never seen in 8-bit software: “Open invoicing,” complete error checking, statements you can design, set-up any accounting system with up to 10,000 records/disk, 8,000 automatically updated inventory items at three locations on just TWO disks, remote terminals. Multi-page continuous report generator with up to 3 spread sheets in “windows” supports any printout/print form imaginable including checks.

Plus spread sheets to 60 columns, full database sorting, string search. Graphic, calendar output. File Manager users: imagine information from up to 500 “files” in one printout, FAST. Search all “fields” at once. Never type headings in printouts. Never erase old info again! Please request list of 200 additional features.

Fully utilizes EVERY power upgrade like ramdisks, drives, DOSes, hard disks, now and in the future including 3 1/2” drives, MIO board, BASIC XE™, R-Time-8™, allowing STEPPED UPGRADES from a \$200 system to a 30 MG hard disk system! 1 drive req.

7 FULLY INTEGRATED PROGRAMS: Directory Database (with mailing), Dated Records Database Manager (includes complete General Ledger/AP), Invoicing/Statements/AR, Report Generator, Inventory, Word Processor, Payroll + business utilities. NOT JUST FOR BUSINESS! Suitable for any database purpose except scientific/telecommunications. 3-7 times the capacity for clubs, histories, scheduling, teacher's grades, scores, dating service, book references... YOU NAME IT! Third generation manual suitable for beginners. Free set-up of your application if needed.

WE KNOW it sounds IMPOSSIBLE, FANTASTIC, LUDICROUS! You've demanded ABSOLUTE PROOF, so HERE IT IS!... Quotes from numerous letters we have received from BONAFIDE CUSTOMERS (not our friends and relatives!) about “TURBOBASES”™ predecessor, MICROMOD 3.0. Please request our complete unedited file of these letters and many more, with initials/city/state of customers YOU CAN CALL!

ABOUT MICROMOD:

“Benefits and performance equal to an Apple/IBM system.”
“MICROMOD makes it unnecessary to upgrade to an IBM or ST.”
“Same features as the \$20,000 system I was considering.”
“I have an IBM and I have not found a better package for anywhere near the price.”
“If I had known what I was getting I would have paid twice the price and more.”
“It works, has the speed and capacity needed in business.”
“Capacity exceeds requirements of small firm!”
“Capabilities beyond that of much more expensive hardware and software.”
“Fast and powerful.”
“Smooth working program.”
“Best I have encountered.”
“Unlimited for small business use—the cost is nothing.”
“Never have I seen these business functions combined into such a nice package.”
“Far more user friendly than most business software.”
“I recommend it to all my business associates.”
“Easy to use.”
“Congratulations on your tremendous product.”
“Best I've found for a small business.”
“A do-it-all and do-it-well program.”
“Should meet all your needs.”
“Everything you need to operate your business.”
“When I opened the package I was speechless.”
“Extremely beneficial product.”

ABOUT OUR SUPPORT:

“Incredible help.”
“I've never seen such support.”
“Support that's unheard of in the software industry.”
“Unbelievable—I don't know of any product or service in our economy today that comes close to the support MicroMiser offers.”
“Support to an extent I have never seen.”
“More than any manufacturer.”
“The support is great.”
“Let me congratulate you for your support.”
“Looking forward to doing business with you again.”
“Here's my order for another program for my Dad's business.”
“Best support in the microcomputer software field.”
“Manual is awesome.”
“Thanks for a solution, not just a few hints.”

COMPARING TO SYNTAX™ (SF), VISICALC™ (VC), HOME ACCOUNTANT™ (HA), PEACHTREE™ (PT), DATA PERFECT™ (DP):

“They are good programs, but capacity is a big limitation.”
“HA was awful, SF was useless, DP not enough capacity. MICROMOD is the only one I'm willing to use.”
“MICROMOD does what it took several programs to do. Information in the form YOU choose.”
“MICROMOD much more extensive and easier to use than DP.”
“I have used all these programs and MICROMOD is superior to them all. The power of MICROMOD 3.0 is awesome.”
“Absolutely no comparison.”
“I used VC, SF, DP, and MICROMOD outpaced them all.”
“Much more flexible.”
“With PT you must tailor your application to fit the program, with MICROMOD you tailor the program to fit your application.”
“I purchased SF and never really no comparison to MICROMOD.”
“PT required 3 program disks at \$99 each.”
“Having used SF, HA, and DP I can say that MICROMOD is far beyond and above these programs.”

Need more power? You have two choices: 1. Buy an ST™ or IBM™ clone for \$1,150 + (two drives + software + the usual non-existent support), throw away your 8-bit software and the years it took to learn your system, or 2. Buy MICROMOD TURBOBASE™ for \$159.95 and get PROVEN support/service and GUARANTEED success.

Sorry! Our heavy support commitment may leave little time to respond to thousands of service card inquiries, but we respond with specific info for your application/hardware to mail or phone requests, MicroMiser Software, 1635-A Holden Ave., Orlando, FL 32809.

Tel. (305) 857-6014.

PRAISE ATARI CORP.

When two keys broke off the numeric keyboard of my 1040ST—after the warranty expired—I figured I was in bad shape. However, I ran into a beta tester for Atari Corp. at the Las Vegas CES, who told me I should write to Jack Tramiel and explain the problem.

Three weeks later I received a letter from Atari Technical Services Manager Randy Hain, and 10 days after that I received—free of charge—an entire new ST keyboard.

I was only looking for the two replacement keys, but to have a large company replace an expensive part at company expense was really unexpected. I can't say enough good about Atari Corp.—if you want a computer that you know is supported *and* backed up, then look to Atari.

Richard Draude
Kingman, Arizona

MONITORING THE ST

Is the Atari monochrome monitor the only “brand” of monitor that works with the ST, or will green or amber monitors manufactured by other companies work?

Mark Brown
Ashland, OR

Any monitor, color or monochrome, can display the ST monochrome signal—provided the monitor can lock onto the non-standard “sync” signals sent out by the ST. The ST monochrome signal runs at about 70 Hertz vertical and 31.5 kilohertz horizontal. The NEC MultiSync can handle the 31.5 kHz, but the picture might roll while trying to lock onto the non-standard 70 Hz. Even if you found a compatible monitor, you'd have to build a customized hookup cable running from your monitor to the Atari's DIN 13-pin video plug. You'll also need to hook pin 4 of the video plug to the ground to alert the ST to send out a monochrome signal. Why not just stick with the inexpensive, rock-solid Atari SM124 monitor?—ANTIC ED

FIND MY RAM

I have an 800XL with 8K of RAM missing. I changed all eight RAM chips and got the same result. The BASIC FRE(0) function shows 37,902 bytes available. What could be the problem?

George Simon
CompuServe
ID 72347,2657

Newer users often ask this question. Your Atari 800XL (as well as the Commodore 64 and the Apple IIe) is advertised as a 64K computer. Putting it simply, this means that the 6502 microprocessor chip which is the heart of the computer can address a maximum 64K of memory. But approximately 16K of memory is reserved for the operating system and other overhead such as screen memory. DOS uses a little more. When you use BASIC, 8K of the remaining RAM is replaced by 8K of ROM.

FRENCH DOS

With regard to Clement Carbonneau's question about re-writing the DOS menu in French (*Antic*, April 1987): *Anything* can be loaded to AtariWriter. Therefore, you can load the DUP.SYS file from the DOS menu into AtariWriter. Edit the file—making sure that your new text message has exactly the same number of characters as the original text—and save it just like any other file. Some files come up weird when you do this, but not DUP.SYS.

Beth Jane Freeman
CompuServe ID
71777,3172

MILES AWAY

I'm trying desperately to find the Miles Computing accounting programs (General Ledger, Payroll, etc.). Can anyone help me?

J.P. Coggins
Fernandina Beach,
Florida

Antic reviewed the Miles Payroll Accounting System in January, 1987. Here's the address: Miles Computing Inc., 21018 Osborne Street, Building 5, Canoga Park, CA 91304. (818) 341-1411.—ANTIC ED

1200XL BLUES

Readers still ask if the Atari 1200XL is really incompatible with most 800 and 800XL programs. The answer is that, with a translator disk such as FIX XL (\$10, The Catalog, PD0026) the 1200XL should work with almost all 800 and 800XL programs—but since some modems and other devices (such as ICD's P:R: Connection) draw their power from the serial port, the software controlling the devices won't work because the 1200XL serial port doesn't supply power the same way as other Atari 8-bit computers. There will also be problems with Atari 800 multiplayer games that access joystick ports 3 and 4.—ANTIC ED

ROTATE FIX

ROTATE FIX

If you tried and failed to get *Rotate* from the February, 1987 Tech Tips to work, here is the fix:

1. Change the 2317 in line 40 to 217.
2. Change the 233 in line 40 to 223.
3. Change the 4C in line 70 to 40.
4. Change the 102 in line 80 to 1024.

TELECOMMUNICATIONS

Exactly what do I need in order to transfer Atariwriter text files from my Atari 800XL or 130XE to my IBM-compatible Leading Edge D at work?

Patrick Lyle
Wheeling, WV

Each computer needs its own modem and communications software. The modems should both be capable of transmitting at the same baud rate, usually 300 or 1200. Your software must use the same file transfer protocols (“bandsbaking”), so look for two programs with a common file transfer method. For the Atari, we suggest Backtalk 1.2 (\$19.95, The Catalog, APO154), which supports both XMODEM and XON/XOFF protocols and can translate the weird Atari carriage returns into standard ones. It works with the XM301, as well as other modems.—ANTIC ED

ULTIMATE PRINTER?

You called the Star SB-10 "the ultimate dot-matrix printer" (*Antic*, February 1986). Print Shop and Megafont II+ don't work on the SB-10. Broderbund said its programs don't work with 24-pin printers, and Star Micronics said the SB-10 isn't compatible with any other printer. Since you claim that it's the ultimate printer and use it for your listings, please tell me what programs *do* work with the SB-10.

Roger Brownell
Compuserve I.D.
71777,164

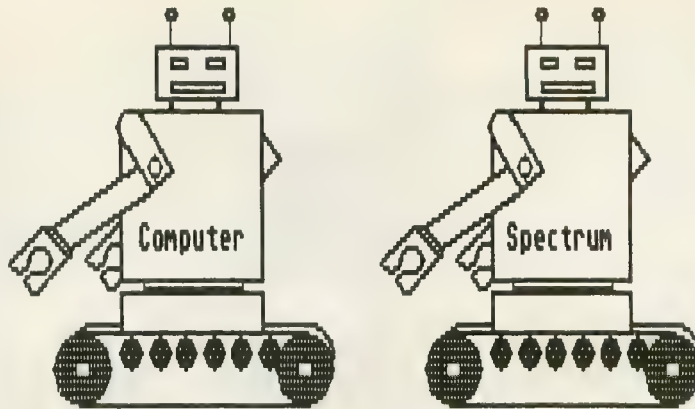

Antic considers 24-pin printers like the Star SB-10 the "ultimate" because of their near laser printer resolution. We never claimed that the SB-10 was Epson-compatible. When we decided to use the SB-10 to print our program listings, in-house programmer Patrick Bass created a complete 24-pin font editor/listings printer program, which runs on any Atari 8-bit computer with at least 48K.

For those who can program, the SB-10 printer manual has plenty of information on sending commands to the printer. If you don't program, you should still be able to teach any word processing software allowing the creation of a "printer driver"—such as AtariWriter or AtariWriter Plus—how to converse with the SB-10. We have not, however, succeeded in getting PaperClip to work with the SB-10.

On the ST, we use the SB-10 for letter quality printouts by simply double-clicking on a text file and then selecting "Print File" from the desktop. Any ASCII file printout should be fine. For printing ST pictures, DEGAS includes an SB-10 printer driver.—ANTIC ED

Antic welcomes your feedback, but we regret that the large volume of mail makes it impossible for the Editors to reply to everyone. Although we do respond to as much reader correspondence as time permits, our highest priority must be to publish I/O answers to questions that are meaningful to a substantial number of readers.

Send letters to: *Antic* I/O Board,
544 Second Street, San Francisco,
CA 94107. 

Computer Spectrum presents

"YOUR ST COMES ALIVE!"

Build multiple modem controllers, light pen, speech synthesizers, event detectors, stepper motor controllers, 120 volt circuit controllers, networking projects, and much more. Four chapters include interfacing with the joystick, cartridge, MIDI, and printer ports. Complete with disk of demo programs for \$29.95.

"YOUR 8 BIT COMES ALIVE!"

Build tone decoders, infrared communicators, networking, synthesizer add-ons, light pen, and much more. Complete with disk of demo programs for \$24.95.

"THE SCIENTIFIC ST"

Science projects include biofeedback experiments, weather experiments, biological experiments, etc. Enjoy an edge over others with these high-tech projects. Complete with demo disk for \$29.95.

"THE SCIENTIFIC 8 BIT"

Same as above book but for 8 Bit Atari. Complete with demo disk for \$24.95.

MATH LANDER

Manuever your landing module through dangerous situations by correctly answering whole number math problems. Eight different screens provide variety and challenge. For ST only, \$29.95.

FRACTION BOULDERS

Fly your saucer in search of correct answers while avoiding dangerous boulders. Sharpen up your fraction skills while having fun. For ST only, \$29.95.

KRACK THE KREMLIN

A series of codes must be broken in order to get through the Kremlin's defenses. Decimal and percent problems are presented and correct answers reveal necessary information. For ST only, \$29.95.

IF WE ADVERTISE IT, WE HAVE IT!

Dealer Inquiries Welcome

● Flight Simulator II

● Scenery Disks

The Challenge of Accomplished Flight

With a realism comparable to (and in some ways even surpassing) \$100,000 aircraft flight simulators, Flight Simulator II includes full flight instrumentation and avionics, and provides a full-color out-the-window view. Instruments are arranged in the format standard to modern aircraft. All the radios needed for IFR flight are included. Front, rear, left, right, and diagonal views let you look in any direction. Program features are clearly documented in a 96-page Pilot's Operating Handbook.

For training in proper flight techniques, Flight Simulator II includes another 96-page instruction manual, compiled by two professional flight instructors with over 8,000 hours flight time and 12,000 hours of aviation teaching experience. You'll learn correct FAA-recommended flight procedures, from basic aircraft control through instrument approaches. To reward your accomplishments, the manual even includes a section on aerobatic maneuvers.

The Realism and Beauty of Flight

Go sight-seeing over detailed, realistic United States scenery. High-speed graphic drivers provide an animated out-the-window view in either day, dusk, or night flying modes.

Flight Simulator II features over 80 airports in four different scenery areas: New York, Chicago, Seattle, and Los Angeles. Additional Scenery Disks covering much of the United States are now available for all computer versions of Flight Simulator II.

Each disk covers a geographical region of the country in detail, and is very reasonably priced.

The Pure Fun of "World War I Ace"

When you think you're ready, you can test your flying skills with the "World War I Ace" aerial battle game. This game sends you on a bombing run over heavily-defended enemy territory. Six enemy fighters will attempt to engage you in combat as soon as war is declared. Your aircraft can carry five bombs, and your machine guns are loaded with 100 rounds of ammunition.

See Your Dealer. Flight Simulator II is available on disk for the Apple II, Atari 800/XL/XE, and Commodore 64/128 computers for \$49.95. Additional Scenery Disks are \$19.95 each. \$199 (Includes 128K and 3 fonts)

CIRCLE 197 ON READER SERVICE CARD

Reviewed by Charles Cherry

The impressive **StyleWriter** is a box about the size of a Hayes modem that gives your dot matrix printer a variety of very high quality fonts. The \$199 model also provides a printer buffer of 128K. (You can get smaller-memory units with 8K for \$99 or 64K for \$169.) *Figure 1* shows the six fonts which came with our review sample. Eleven other fonts are currently available and we can expect more in the future. Font chips cost \$13.95 apiece and StyleWriter can hold six chips at a time. The font styles come in several sizes, but each chip can only contain one font in one size.

StyleWriter is actually very easy to use. It comes *pre-configured* for your specific computer and printer, so all you need to do is hook it up and it should work immediately. The print styles are controlled by simple codes that you type into your word processor text. In addition to changing fonts, you can also use a variety of special printing modes (see *Figure 2*). Note that the inverse printing (white on black) did not work very well with the Epson FX-80 I used for this review.

StyleWriter's font chips are proportional typefaces, so your word processor will not be able to control the spacing properly. To overcome this, StyleWriter provides its own commands that control the margins, tabs, centering and justification. There is no command for aligning text from the right margin. All control codes are a simple backslash (\) followed by letters or numbers.

Although it is not mentioned in the generally very good manual, DIP switch three inside the StyleWriter box will change the control character from \ to @. DIP switch four

controls the line feed for the printer. You will need to change that if you move your StyleWriter from an 8-bit Atari to an ST.

StyleWriter achieves its excellent results by taking control of your printer in its graphic mode. Six passes of the printer head are required to print each line. There is a high quality mode which takes 12 passes. All this is obviously time-consuming. However, there is a bypass button which turns StyleWriter into a plain-vanilla buffer, so your printer can work at its normal speed. This makes it a snap to print out draft copies until everything is perfect and then punch in the StyleWriter and go get a sandwich while it prints the final copy.

If you do much printing and a good-looking output is important to you, you should definitely consider invest-

continued on next page

ing in a StyleWriter. It is reasonably priced and will greatly enhance your pages. For most people it will eliminate the need for a daisywheel printer. If you change printers in the future, you can have your StyleWriter reconfigured at the factory. There is currently no charge for this.

It is obvious that a lot of thought, care, and an awful

lot of work has gone into developing StyleWriter. My only quibble is wanting even more of what is already there—more fonts built into the box, larger memory buffer, bigger and smaller font sizes, etc. Although the review period is over, I don't want to give back my StyleWriter. I like it a lot.

QUIK PIX

White Lion Software
 P.O. Box 357
 Ridge, NY 11961
 (516) 924-6071
 \$29.95, 48K disk

CIRCLE 192 ON READER SERVICE CARD

Users of AtariWriter, AtariWriter Plus and PaperClip word processors can use **Quik Pix** to put Broderbund's Print Shop Graphics Library pictures into their text printouts. Pictures can be saved as "pix," letterhead—or labels that use the Mail Merge features of these word processors. There are also 12 choices of horizontal borders. Text, graphics and borders are printed in one pass.

But the great thing about Quik Pix is that you can convert *any* picture—if you convert it to Print Shop format first. And virtually any graphic format for 8-bit Atari can be converted with Graphics Shop (\$19.95, The Catalog, APO157). Also, if you want to use graphics from the *original* Print Shop program disk as well as the Print Shop Graphics Library disks, see the simple DESIGNING LABELS fix in this issue's I/O letters.

Quik Pix is menu-driven and has drop-down windows and single-keystroke commands. The manual is thorough, but not exactly easy to read. If you make a mistake you can't correct, you must press the [ESC] key and start the operation over. The Quik Pix basic process is easy enough to do. But the fancier you want your file to be, the harder you must work.

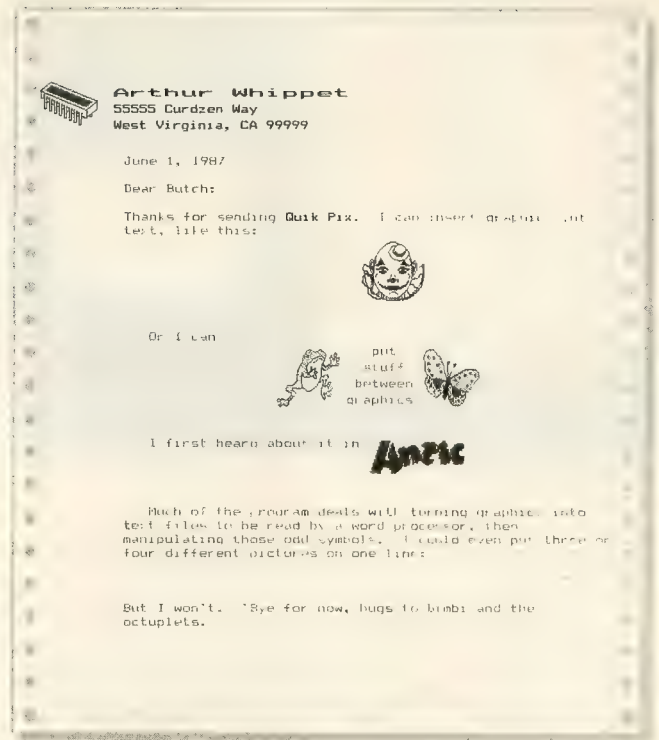

Quik Pix comes in two separate versions that work slightly differently, depending on which word processor they were written for. The remainder of this review will cover each version individually.

QUIK PIX PC

Quik Pix PC uses PaperClip's Include File and Verbatim File commands. Include File lets you chain as many as three files so that they'll print as one. For instance, here

Quik Pix graphics files as seen with PaperClip (left) and AtariWriter Plus.

are the steps you might take if you were writing a 12,000-word paper:

1. Since 12,000 words works out to about 48 double-spaced pages and PaperClip's maximum file length is approximately 20 pages, write the document in three sections, saving them as D:DOC.1, D:DOC.2 and D:DOC.3
2. Read DOC.1 to the screen.
3. Instead of having to append the other two files (which won't work anyway), *include* them by adding the following to the end of the document:

```
[CONTROL] [Z] ID:DOC.2
[CONTROL] [Z] ID:DOC.3
```

4. If you want to print it later, write DOC.1 back to disk. To do so now, however, simultaneously press [CONTROL] [SHIFT] [ESCAPE] to print. When the printer reaches the end of the document and sees those include commands, DOC.2 and DOC.3 will be read directly from the disk to the printer.

The Verbatim File command does the same thing, but for PaperClip-compatible graphics. It takes data from the disk file—such as B/Graph charts and Micro Illustrator pictures—and prints this verbatim.

Here's where Quik Pix PC comes in. It converts Print Shop Library graphics to *PaperClip* format so that they can be included in text files.

To get the desired effects, however, you must read the converted file into PaperClip and fiddle around. All PaperClip users know that the underlined, crooked arrow pointing left is the carriage return symbol. Few users know that the *inverse* carriage return is the *escape* symbol—which you can't create by typing in PaperClip. True, you can

continued on next page

Quik Pix menu screen.

duplicate this with the block copy function, [CONTROL] [M]—but why would you?

A PaperClip representation of a graphics file looks like so many garbage characters. (See *Figure 1*.) But there is a pattern—each logical line begins with an escape symbol and ends with a carriage return. And there's only one of each per logical line.

Unless you change the file, the graphic will be printed in column 1 on your paper. However, if you put 35 spaces before each escape symbol, the printer will center the picture, as it did with the clown in the sample letter.

PC MULTI-PIX

If you want more than one graphic on one line, you really have your work cut out for you, although PaperClip's two windows make it easier. In *Figure 1*, to get the frog, butterfly and text on the same line, call the frog file into window 1 and the butterfly file into window 2. Then:

1. Number each line, adding the numbers *before* the escape symbol. In the top window you might number the lines 111, 222, etc., using 1111, 2222, etc. in the bottom. The lines with three digits would come before the ones with four, making things easier.

2. Go to line 1111 in window 2 and use [SHIFT] [DELETE] to put each screen line of that logical line into the paste buffer.

3. Hop back up to window 1, put the cursor on 222 and simultaneously press [CONTROL] [SHIFT] [P] to put line 1111 under line 111.

4. Delete the carriage return in line 111 and add 10 spaces.

5. Press [CONTROL] [SHIFT] [I] to get into the overwrite mode and center the word "put" in those 10 spaces.

6. Delete the 111 and 1111. Now the first logical line is complete.

7. Repeat steps 2-6, adding words where appropriate. The new picture file is ready, so save it to disk.

If this sounds like a hassle, that's because it is. But it's easy to get used to, although plenty challenging at first. Expect a lot of trial and error before you get what you want.

The Antic Magazine graphic in *Figure 1* came from the Picture Plus disk (\$19.95, The Catalog, APO179) and was in Micro Illustrator format. Graphics Shop was needed to convert the picture to Print Shop format. However, since the graphic was directly in the center of the screen on a white background, we didn't want to convert the entire screen.

Converting part of a picture entails putting a frame around the area to be captured. While this feature works well, it isn't terribly flexible—you can't shrink or expand the frame to fit the graphic—so we had to make two files. It wasn't easy to place the frame so as not to duplicate parts of the picture. Then these files had to be converted to PaperClip format with Quik Pix PC.

The name and address at the top of *Figure 1* were made with the letterhead option. A label would look about the same.

ATARIWRITER QUIK PIX

Neither AtariWriter nor AtariWriter+ has a verbatim command, but you can load and print a converted graphics file right away. Graphics can be converted in either normal or compressed mode in this version of Quik Pix.

The compressed mode is used if a picture is too wide for AtariWriter Plus. Quik Pix documentation points out that AtariWriter Plus is slightly *more* limiting than AtariWriter in terms of graphics, and if you try to print a non-compressed picture the computer might lock up. If this happens, just press [RESET]—everything in memory will remain there.

PaperClip graphics files are easier to interpret than AtariWriter files—where the escape character is just represented by a 27. The other codes are also represented in decimal form. This may sound easier to deal with than those odd PaperClip symbols, but AtariWriter files are longer, and it's harder to see where one logical line ends and another begins.

With the Merge File command, [OPTION] [L], you can get several pictures into one file, but trying to put more than one on a line is even harder than with the PaperClip version.

However, Quik Pix is fun to experiment with. Try putting one graphic directly next to another. That's easy—after you figure out how. But now try putting one directly *above* another. It's extremely satisfying to get your text, graphics and borders looking just right.—GREGG PEARLMAN

YEMACYB
Electronical Software
P.O. Box 8035
Rochester, MI 48063
\$21.95, 48K disk

CIRCLE 193 ON READER SERVICE CARD

YEMACYB prints microscreens in color on Epson MX/80, Star 10X/SG-10 and C.Itoh Prowriter printers and compatibles. The program requires four colored ribbons, yellow, cyan, magenta and black. Printing takes four passes,

Four-pass color printout on standard one-color dot-matrix printer with YEMACYB.

and you must change the ribbon for each pass. You can order the program with the ribbons for \$18 to \$26 more, depending on your printer.

YEMACYB does its job well. I tested it with Star's Gemini 10X and the results were better than with most color printers. YEMACYB maintains a palette that defines the blend for each of the Atari's 128 colors. A separate program lets you change the palette if the printout doesn't match your screen exactly.

YEMACYB supports Graphics 7 and Graphics 7 1/2 (ANTIC mode E) screens in uncompressed 62-sector format. It also supports display list interrupts (DLIs). You can change any or all colors at every scan line. The resulting picture can be printed in only one size—my printer printed it sideways, 6 3/8x8 1/4 inches.

On the downside, the program is not easy to use. The process of backing up the printer and aligning the page is inefficient even at the best of times. This program does nothing to help and there's a bug in the alignment routine. The DLI feature is user-hostile. You can't even see the picture as you are changing it. All of this aggravated by a poor manual.

On balance, YEMACYB is worth having. Nothing else does what it does, and the results are impressive. I just hope that future versions improve the user interface.—CHARLES CHERRY

MAGNIPRINT II+
Alpha Systems
4435 Maplepark Road
Stow, Ohio 44224
(216) 374-7469
\$24.95, 48K disk

CIRCLE 194 ON READER SERVICE CARD

Magniprint II+ has been around for quite a while and won many satisfied users. Version 3 now adds four different text sizes and compatibility with Typesetter icons to an already impressive list of capabilities. Although it does not do everything (such as mirror images for T-shirts), Magniprint II+, Version 3 will fulfill most of your printing needs.

Magniprint II+ can take a microscreen in any mode and

print it in several sizes, normal or sideways, with up to 16 gray levels. It can also produce gigantic multi-page poster printouts. Magniprint II+ produces the best quality picture your printer can deliver.

This program loads a picture in any format—even Print Shop—and lets you touch up the drawing, change the colors, assign a gray scale and add text using normal or custom fonts. Large text has vertical lines. Printing is in two full-screen sizes—three, if you count the convenient Quick Print previewer. Larger sizes can be printed in sections which you can designate, within limits.

Special features include a lister, which reproduces text files exactly as they appear on screen, including inverse and graphic characters—ideal for listing BASIC programs. You can also fine-tune the printer's line-feed to preserve the aspect ratio of your picture (so circles come out round instead of oval).

Magniprint II+'s best features are its excellent GTIA 16-shade printouts and the remarkable (yet easy) gigantic, multi-page posters. Disappointments include the slow "multi-load" operation and the separate conversion process needed to use most picture formats.

Magniprint II+ supports Epson, Panasonic, C. Itoh, NEC, and Star dot-matrix printers and compatibles.—CHARLES CHERRY

NEWS STATION
Reeve Software
29W150 Old Farm Lane
Warrenville, IL 60555
(312) 393-2317
\$29.95, 48K disk

CIRCLE 195 ON READER SERVICE CARD

Here's another attempt to bring desktop publishing to the 8-bit Atari. As always, the problem is not enough memory. You can't put a whole page in the computer and still have room for a program.

continued on next page

THE NEWS STATION

USE ICONS FROM THE PRINT SHOP

Text can be used in 8 different heights AND/OR 8 different widths.

12345678
*2345678
64 SIZES

CHANGE FONTS AT WILL

ALSO INCLUDE PICTURES

News Station divides the page into eight "plates" which must each be composed and saved to disk individually. Once all eight are created and saved, the page is printed. The plates are printed in this arrangement:

- PLATE 1 PLATE 2
- PLATE 3 PLATE 4
- PLATE 5 PLATE 6
- PLATE 7 PLATE 8

This works fine for two-column printouts, but full-page composing is difficult.

You can typeset your text with custom 8x8 character sets in 64 sizes. Five fonts are provided, but there is no font editor. You can draw freehand with a joystick or touch tablet, or load pictures, Print Shop icons and short text files.

But with 64 text sizes, News Station is an ideal tool for putting lettering into a picture. Also, the plate concept makes it easy to replicate an image eight times on a page. However, you might find it too restricted for serious typesetting and printing.—CHARLES CHERRY

ASCII Art Converter

“Printer pictures” go hi-res

BY PAUL TUPACZEWSKI

Thousands of “character art” pictures can be found online, free for the downloading. ASCII Art Converter transfers this visual treasure trove into Atari high-resolution graphics formats—so you can enhance the pictures with your favorite paint software. This BASIC program works on 8-bit Atari computers with a minimum of 48K memory and a disk drive.

If you have ever have logged onto a bulletin board—especially a non-Atari BBS—you may have noticed sections of the board offering something called “printer art” or “ASCII character art.” You can download these “picture” files and put them into your word processor to make hard copies with any type of printer. Type GO ARTSIG when you log onto CompuServe and you’ll find a vast storehouse of ASCII art files.

ASCII art works by taking various characters—X, M, 9, etc.—and combining them in patterns to make pictures. When you stand up close, the pictures don’t look like anything except a jumble of letters and numbers. But when you stand back, you’ll see a detailed image—perhaps Abraham Lincoln or Marilyn Monroe. For users of most personal computers, this is a satisfactory online graphic compromise. But with the powerful graphics of your 8-bit Atari and this ASCII Art Converter software, you can do a lot better.

ASCII Art Converter speedily translates printer art files

into the Atari’s high-resolution graphics modes. After conversion, your picture will have four shades of gray—and you can then enhance this image with any popular Atari paint program. (Rapid Graphics Converter from the November 1985 *Antic* enables you to convert graphics files between all paint software formats.—ANTIC ED)

Get started by typing in Listing 1, ARTCONVR.BAS. Check it with TYPO II and SAVE a copy before you RUN it. When RUN, it creates the actual ASCII Art Converter machine language file, ARTCONVR.EXE, which can be loaded from DOS using option L. Or you can make the converter self-loading by renaming it AUTORUN.SYS and putting it on a disk that contains DOS 2 or 2.5.

A bonus for Antic Disk owners is Listing 2, ARTCONVR.M65, the MAC/65 assembly language source code for the ASCII Converter. It was too lengthy to print in this issue. You do *not* need Listing 2 in order to operate the ASCII Art Converter.

CONVERTER COMMANDS

Following are the main menu commands you’ll see when you load the converter:

[C]olumn number—Most printer art files are meant for 80-column printers, but some are in compressed 132-column mode. [C] toggles between 80-columns and 132-columns.

[L]oad file—Here is where you enter the printer art filename.

[D]rive default number—Choose any number from 1 to 8. Using a RAMdisk (D8:) speeds conversion greatly.

[P]osition of picture—When printed, some art files are supposed to be looked at vertically, others horizontally. This option rotates an arrow that specifies the *top* of the image.

[G]raphics mode—This option is handy for “compress-

Easy 80

Readable software 80-column text

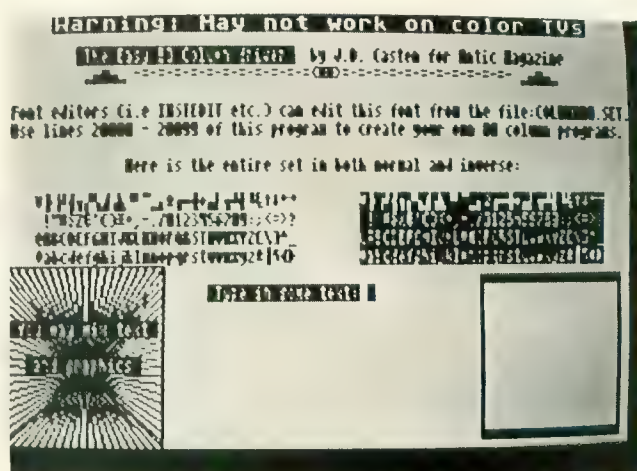

BY J. D. CASTEN

This versatile subroutine displays 80 columns of readable text (even combined with pictures too) on a Graphics 8 screen.

Easy 80 includes an impressive demonstration of what the 80-column display can do. But this subroutine is primarily meant for insertion in your own BASIC programs. Easy 80 is a BASIC program that works on all 8-bit Atari computers of any memory size, with disk or cassette. However, Easy 80 text is not likely to be too readable on a television set or on some color monitors.

A major limitation of 8-bit Atari text is the 40-column display, which greatly limits the amount of information that can be shown at one time and hampers translation of programs from 80-column computers to the Atari. Easy 80 provides an efficient, flexible access to 80 readable columns with no additional hardware. How much use you get from Easy 80 depends on your needs, programming expertise and imagination.

(Also Note: Readability of Easy 80 text depends largely on the quality of your video display. Standard television sets don't have high enough resolution to produce good details. For best results with a color monitor, turn down your Color and Tint controls as low as they will

go. Adjust any other controls that will make your color screen resemble a monochrome display.—ANTIC ED)

GETTING STARTED

Type in Listing 1, EASY80.BAS, check it with TYPO II and SAVE a copy before you RUN it. The actual 80-column subroutine consists of lines 20000-20199 within the Easy 80 demonstration program.

Next, type in Listing 2, CHARMAKE.BAS, check it with TYPO II and SAVE as before. When RUN, Listing 2 creates a file called COLUMN80.SET. This is the Easy 80 character set, similar to character sets made with *Ultrafont* (Antic, August 1986) or *Envision* (\$19.95, The Catalog, AP0185).

You don't need a font editor program to use Easy 80, but with a font editor you can alter the COLUMN80.SET file created by Listing 2. Just operate your font editor with the COLUMN80.SET file like you would for any other character set file.

To use the 80-column subroutine in your own programs, simply LIST lines 20000-20199 to a separate disk file, then

ENTER them into your BASIC program.

PROGRAM TAKE-APART

The 80-column subroutine has two main parts. The initializing routine starts at line 20000. GOSUB here at the beginning of your program. The PRINT subroutine is at line 20099. These routines use the following variables:

E80\$—contains the machine language program for the 80-column driver.

T80\$—contains the text to be printed.

CHBAS—the location of the 80-column character set in memory. This can be altered to any location divisible by 1K (1024).

X80—the horizontal coordinate of the text to be printed; can be from 0 to 79.

*Tired of waiting
for a readable
80-column word
processor for the
8-bit Atari?
Then write one
yourself with help from
Easy 80. Even the Atari
[CONTROL] characters
will appear as
legible as in standard
40-column mode.*

Y80—the vertical coordinate of the text to be printed; can be from 0 to 23.

To use the PRINT routine, set the variables T80\$, X80 and Y80, and GOSUB to line 20199.

The demonstration program shows some effective ways to use the 80-column routine. Hopefully you will find a good use for Easy 80—whether you're just showing off the demo or writing an 80-column word processor. ☑

With Easy 80, J.D. Casten departs from the chase-and-shoot maze games which made him an Antic programming favorite. Longtime readers of this magazine will be familiar with Casten games such as Risky Rescue (April 1984), Biffdrop (December 1984) and Rebound (January 1987).

"The most useful program for the Atari since Print Shop!"

FORMS GENERATOR for the Atari 800, 800XL, 65XE, 130XE

Designed by Jeff Brenner, columnist for Computer Shopper magazine, of "Applying The Atari" fame, and author of book and magazine articles in COMPUTE!, ANALOG and others.

LOOK WHAT YOU CAN DO WITH FORMS GENERATOR: Purchase merchandise by mail? Next time, send a customized purchase order form! Does your home or business ever need statements, invoices, proposals, job work orders, gift certificates, etc.? No problem! Use FORMS GENERATOR's scrolling spreadsheet-style screen to design almost any form to suit your exact needs. What you see on-screen is what you get on paper! Use the text mode with any 80-column printer, or the high-res graphics mode with the Epson, Gemini/Star, Okidata, Panasonic or Prowriter for remarkably realistic forms. BUT THAT'S JUST THE BEGINNING: Once you've designed a form, you can program FORMS GENERATOR to make all calculations automatically! Imagine: after you enter quantities, descriptions and prices, FORMS GENERATOR moves about the form calculating extended prices, subtotals, and even the sales tax! Like magic! (Sample invoices included). You can also use FORMS GENERATOR for record keeping, since you can save filled forms to disk!

Read what our customers have written: "Excellent... easy to use and ran perfect!(ly) ... T.W. Wethersfield, Connecticut: "I was most impressed with your FORMS GENERATOR program..." J.E. King, South Carolina: "Love it!" C.R. Cortland, Ohio. Our "down to planet Earth" price: Only \$23.95 (product #ATA611).

VISA/MASTERCARD or C.O.D. orders: CALL TOLL FREE (24 HOURS) 1-800-346-6000 (Operators can only take orders) Or send coupon below.

Miracle Box From Atari

True 80-column text at last

BY CHARLES JACKSON, ANTIC TECHNICAL EDITOR

the stores when the XEP80 arrives in June 1987.

AtariWriter 80 and a new 80-column, single-density version of Atari's **Silent Butler** personal finance program will be the first commercial software that runs on the XEP80. However, early prototype versions of the XEP80 box were sent to major publishers of 8-bit software—such as Batteries Included, Broderbund, XLEnt and OSS—with the expectation that existing products will soon be updated for 80 columns.

Inexpensive 80-column trade-up prices for users of the existing AtariWriter Plus and Silent Butler will be offered by Atari, according to Skruch. But no prices for the software have been set as of this writing.

USING XEP80

The XEP80 is about the size of a 1030 modem (5 3/8×9 1/4×1-3/8 inches) and weighs in at just two pounds. It can easily fit atop your disk drive.

The XEP80 connects to your Atari through either joystick port 1 or 2. An XL/XE RCA-jack video cable carries the signal from the back of the XEP80 to your monitor. (Atari says the XEP80 display will not be satisfactory on a television set.)

Keeping the system running is a small 9-volt power supply, the same power unit used with the 2600 video-game system and the still-awaited Atari 1200-baud modem. Note: The

It's here.

Arriving at **Antic** just as we were about to go to press, the long-promised **XEP80** 80-column box is being manufactured at the Atari Corp.'s Taiwan manufacturing center and should be available in stores for \$79.95 by the time you read this.

The XEP80 displays 80 columns and 24 rows of readable text on your screen. On monochrome monitors, this text is razor-sharp. It's also quite readable on a color monitor, though

naturally the characters are smaller than standard 40-column Atari text. Either way, the XEP80 is far superior to any software-only commercial products that produce an 80-column display.

COMPATIBLE SOFTWARE

According to John Skruch, Atari's Associate Director for Software, **AtariWriter 80**—a new 80-column upgrade of the AtariWriter Plus word processor—was undergoing final testing at deadline and should also be in

power supply that came with our prototype XEP80 tended to grow unusually hot.

The XEP80 also includes a parallel printer port that uses the same 25-pin cable as the ST. If you hold down the [SELECT] key when you boot your computer, the XEP80 will serve only as a parallel printer interface—without turning on the 80-column display.

UTILITIES AND DEMOS

The disk that comes with the XEP80 contains the AUTORUN.SYS file which installs the handler (which is only about 200 bytes). Commented MAC/65-compatible source code for the handler is also included. Atari's Lane Winner is credited as the main designer of the XEP80 system.

The disk also features a number of impressive demonstration programs

written in BASIC and assembly language, as well as detailed documentation and utility software for inserting 80-column handler routines into your own programs.

The XEP80 handler introduces several new commands to Atari BASIC. These take the form of XIO statements which:

- Invert the screen colors (default is white text on a black background).
- Enable underlining.
- Produce a blinking cursor.
- Mix double-width or double-height text with standard-size text.
- Mix blinking text (any width or height) with standard text.
- Enable character-by-character horizontal scrolling with a POSITION statement and an XIO statement.

The XEP80 is immediately compatible with all software that supports E-calls—such as Atari BASIC (versions A, B and C) and Atari DOS 2.5. During our tests, the XEP80 didn't work with DOS 2.0.

GRAPHICS

Built into the XEP80 is 8K of static RAM, which is used as a screen storage buffer to operate the display faster. The XEP80 has two complete character sets built in, the standard XL/XE special character set and Atari's international character set.

The XEP80 can draw high-resolution bit-mapped graphics covering as much as half the screen. However, the 80-column drawing routines are much slower than standard 40-column drawing. It took five minutes to draw and fill a golfball-sized circle in Graphics 8.

Drawing isn't simple either. The PLOT and DRAWTO statements are not supported and text windows are not allowed. If your program crashes in the middle of one of these lengthy and complicated bit-map operations, the display remains in bit-mapped mode. You must reboot and start again.

SUMMARY

If you're serious about an 80-column display, the XEP80 won't disappoint you. The text is outstanding on monochrome monitors and acceptably readable on composite color monitors. Beginning and intermediate BASIC programmers will want to explore new ways to use the XEP80's additional XIO commands. Advanced BASIC and assembly language programmers will enjoy adapting the XEP80 handler to their favorite business software, word processor or telecommunications program.

Atari Animation

Lesson 2: Moving Characters

BY ROBIN ALAN SHERER

This series teaches you how to make Atari 8-bit graphics move. It is written for programmers with some experience in Atari BASIC. But any 8-bit Atari user with minimum 32K memory, disk or cassette, can enjoy the short BASIC type-in graphics demonstrations accompanying each lesson.

Last month we drew the shape of a haunted house. Now we will begin to put animated characters into the picture.

First we must find a safe place for the new character set we'll create. You must always protect data by placing it somewhere that won't be written over. Both BASIC and the operating system are constantly moving code all over the place. Fortunately it's easy to create safe havens.

MEMTOP AND RAMTOP

Memory use limitation is controlled by RAMTOP at location 106 and MEMTOP at locations 741 and 742. These locations hold values representing 256-byte pages of memory. By changing the values at these locations, we can fool the computer into thinking that some of its unused memory is already full.

See *Figure 1*. RAMTOP holds the highest page number of free RAM memory available for use. The operating system won't use memory above this number. By lowering the number, you can use the RAM between the original number and the new number without disturbance. RAMTOP is easier to use than MEMTOP, since you just have

to POKE a lower value into it and do a GRAPHICS call. Everything moves into proper place, except for one problem! When your program ends and you load in another program, it will find less memory than expected.

One way to get location 106 back to its original value is to press the [RESET] key, which cleans out every other new setting as well. You could also end your program properly with a POKE RAMTOP to return its original value, if you saved its value in a variable. But here is an example of an even better way to do this:

```
100 NEWSET = PEEK(740)-8
```

```
110 POKE 106, NEWSET-8
```

```
120 GRAPHICS 0
```

This way whenever 106 is moved down, it is referenced to location 740, which will be constant. It works with Atari BASIC, but not with all BASICs from other companies. Use the RAMTOP (location 106) method with these languages. After moving RAMTOP down by 2K (8 times 256), we have our safe area. Sometimes the first 1K is still unsafe, so we will use the second 1K for our character set. There is a very good reason for the extra precaution:

Anytime a CLEAR SCREEN is executed in Graphics 0,

the first 64 bytes of RAM above RAMTOP are CLEARED! Whenever you make a GRAPHICS call which also causes a CLEAR SCREEN, the first eight characters of your character set will disappear.

This situation is even worse if you allow your screen to scroll up. Did you ever wonder where the old text goes when you LIST and the text flows up the screen? Yep, into the 800 memory locations above RAMTOP. That number 800 comes from the 20 lines of the screen times 40 characters per line.

But why start the new character set 1,024 bytes up in memory, instead of 800? The computer requires a memory location that can be divided by 1,024 for the start of the character set when using Graphics 0, and one that can be divided by 512 when using GRAPHICS 1 or 2. This means either two or four pages at a time.

MOVING CHARACTERS

Now we are ready to start moving an animated character into the HOUSE01.BAS program from last month. We'll need to modify three characters. But first we must move the regular character set from ROM into RAM, so we can work on it:

```
130 CHSET = 57344
140 FOR BYTE = 0 TO 1023
150 POKE NEWSET * 256 + BYTE, PEEK(CHSET + BYTE)
160 NEXT BYTE
```

Wow, it takes a long time to move 1024 bytes, doesn't it? What we need is a machine language routine to do it faster. The machine language routines in these lessons are written so that you can use them in your own BASIC programs—even if do not understand machine language.

But we do need to know how to move machine language routines into our BASIC programs. There are a number of ways to do this, some quite complex. Below is MOVEMEM, a simple machine language method translated into BASIC:

```
10 DIM MM$(41)
20 FOR CHAR=1 TO 41
30 READ CODE
40 MM$(CHAR,CHAR)=CHR$(CODE)
50 NEXT CHAR
60 DATA 104,104,133,204,104,133,203,104,133,206,104
70 DATA 133,205,104,170,160,0,138,208,2,104,168,177
```

```
90 DATA 206,202,224,255,208,233,96
```

```
130 CHSET= 57344
```

```
140 X=USR(ADR(MM$),CHSET,SETNEW * 256,1024)
```

Now the Atari character set is in the RAM area we protected. You can verify this by changing CHBAS:

```
POKE 756,NEWSET
```

SHAPE CHANGING

Next you decide which characters to change into new shapes. There is no point in messing up any of the regular letters, so let's change [CONTROL] [A] through [CONTROL] [C]. These are normally Atari graphics characters and have ATASCII values of one through three.

However, as stated in last month's lesson, the character set has a different order than ATASCII. Look at the chart in your BASIC reference guide. (See Recommended Books at end of article.) You'll see that our three characters have INTERNAL values of 65 to 67.

Now for the new shapes. Meet my favorite character—Prototype! Here are three views (with data) for good old Proto:

###	=	00111000	=	56
# ###	=	01011100	=	92
#####	=	11111110	=	254
#####	=	01111100	=	124
# #	=	01000100	=	68
# # #	=	01001010	=	74
#	=	01000000	=	64

Now here is the code to make Proto move.

```

170 SET = NEWSET * 256

180 FOR CHAR=65 TO 67

190 FOR BYTE = 0 TO 7

200 READ DAT

210 POKE SET+CHAR*8+BYTE,DAT

220 NEXT BYTE

230 NEXT CHAR

1000 DATA 56,92,254,124,68,74,64,160

1010 DATA 56,108,254,124,68,68,68,170

1020 DATA 56,116,254,124,68,164,4,10

```

Our character set is now all ready to use, so let's tell the computer where it is:

```
240 POKE 756, NEWSET
```

And let's use it:

```

250 POKE 752, 1

260 POSITION 10,4

270 PRINT CHR$(4)

280 RESTORE 1100

290 FOR LP=1 TO 3

300 READ CHAR

310 POSITION 10,2

320 PRINT CHR$(CHAR)

```

Notice that all we have to do to animate Proto is print the different versions one after another in the same place, with a small delay between each of them to slow things down so we can see each picture. This technique is used by a lot of programs to do simple (and sometimes complex) animation. For example, the aliens in Space Invaders are created using a redefined character set.

Make the following changes to the program if you want to try the character set in Graphics 1 or 2:

```

120 GRAPHICS 1: REM (OR 2)

240 POKE 756, NEWSET+2

270 PRINT #6;CHR$(4)

320 PRINT #6;CHR$(CHAR)

```

You can get rid of the hearts by redefining the heart character to a space (the data is all 0's). The hearts show up because the heart character is the first character of the set that these graphics modes use. If you need both upper and lowercase characters, all you have to do is redefine the character set so that the graphics characters become upper case letters. You can even use MOVEMEM (MM\$ from above) to do this quickly for you. The following statement will move the uppercase letters into the graphics characters locations in memory:

```
X=USR(ADR(MM$), 57377,NEWSET * 256 + 65,26)
```

Now a [CONTROL] [A] will give you an uppercase A.

ANOTHER TRICK

If you want to switch quickly between several character sets, there are two techniques you can use:

1. You can simply load several character fonts into RAM and switch the character base pointer to the appropriate font. This is inefficient because you must keep many character sets in memory.

2. Use MOVEMEM (MM\$). This little utility will move your character set from a string variable into RAM while the CHARACTER BASE POINTER is already pointing to your newly protected memory reserved for custom fonts. You need only one area for all of your data because the routine will place the correct 1,024 bytes of data into your reserved area so fast you can't tell it's happening.

MAIN PROGRAM ADDS

Now you should type in Listing 1, HOUSE02.LST, check-

Red, White and Blue

More devilish than Rubik's Cube?

BY HEIDI BRUMBAUGH, ANTIC EDITORIAL ASSISTANT

You win the game of Red, White and Blue by converting all the squares from red to blue. To change the color of a square, you just move onto it.

The problem is—you can't move onto a square that is *already* blue.

To play Red White and Blue, type in Listing 1, RWB.BAS, check it with TYPO II and SAVE a copy before you RUN it.

At the start of the game, all the squares except the one you occupy are white. This means their true colors are hidden. The only way to discover

a square's true color is to try moving onto it.

Use your joystick to move up, down, right or left. The color of the new square you have chosen is displayed. If the square is red you will move onto it at once, changing it to blue. However, if the square is already blue the computer will beep, indicating that you cannot move into it.

The red and blue squares are ar-

Celebrate July Fourth by trying to beat your Atari at the challenging logic game of Red, White and Blue. It's a kind of solitaire Othello, with no less than 30 skill levels.

So go ahead and put "Stars and Stripes Forever" on your stereo, turn up the volume as loud as you can stand it, light your sparklers, firecrackers and Piccolo Petes—making sure to observe the local fire safety codes, of course—and get ready to play Red, White and Blue, the first publication of a Game of the Month written by an employee of Antic Publishing. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.

ranged randomly at the beginning of a new game, so you get a different pattern every time you play.

The reason the game can be so hard to win is that once you make a move, you can't go back the way you came. This makes it easy for you to get surrounded by blue squares and blocked from any further moves.

FLIP THE BOARD

But there's a way to escape. You can "flip" the entire board by pressing your joystick button. At once, all the squares that were previously blue will be red—and vice versa. The only

square that doesn't change color is the one you occupy. It always remains blue.

After you flip the board, you will be free to continue moving about the grid with your joystick, trying to forge a path that allows you to change all the red squares to blue without getting trapped again. But even with the help of repeated flipping, some boards will be impossible to solve.

Skill level is determined by the size of the grid. At the opening screen, move your joystick up or down to change the skill level, then press the

continued on next page

joystick button to start playing.

There's not much challenge to a low skill level—a 2×2 or 3×3 grid. It will either be very easy to win or immediately obvious that the board is impossible to solve. However, this is a good place to start if you want to get an idea of how the game works. The highest skill level is limited only by the number of squares that can fit on your video screen. As written, the program's maximum is eight squares. But you can shrink the square size to squeeze more into the grid. Do this by decreasing the value of LSQR in line 11000 to 3 (or even 1) or change MODE to 7+16 to get a higher resolution.

For a super-challenging grid size of 32×32 use MODE 7+16 and a LSQR of 1. However, game speed will slow considerably at this point.

If you get stuck, quit a game and randomize the squares for a new game by pressing the [ESC] key. Or do the same thing by pressing the joystick forward and giving a light tap to the

trigger button. Then use the joystick to confirm that you want to quit and tap the trigger once again. (Antic is fulfilling the request of a March 1987 I/O letter. For the convenience of physically handicapped players, all commands in this game can be given with the joystick.)

ABOUT THE PROGRAM

I originally wrote this game for the IBM PC as a way of better understanding MicroSoft BASIC's logical operators. Commands such as AND, OR and XOR (eXclusive OR) made it very simple to flip a square's value back and forth without using any math. Ironically, when I translated the program into Atari BASIC I had to change the data structure completely to account for that language's sometimes limited syntax.

The values of the squares are held in a two-dimensional array (STAT(X,Y)). If a square is blue (already captured) it has a value of 1. If it is red, its value is 0. To "hide" the squares at the beginning of the game, simply add 10 to that value.

This way, it is easy to see that the integer value of a hidden square (10 or 11) will be 1 if it divided by 10 (see line 5030). If it is not hidden, you "flip" the square by taking the absolute value of STAT(X,Y) subtracted by 1, as in line 5050. (ABS(1-1)=0; ABS(0-1)=1.)

In the original PC version of the program, the four possible square values—0, 1, 10 and 11—were given in binary (0, 1, 2 and 3), to make it easier for the computer to perform its logical operations. The Atari version uses decimal instead, to make it easier on the programmer.

PROGRAM TAKE-APART

Lines 100-499 use subroutines for initialization and opening menus.

500-999 puts the often-used subroutine to draw a square at the beginning to save processing time

1000-1999 is the main routine. It reads joystick value, makes sure the user doesn't want to quit and checks for win after each turn.

2000-2999 makes sure the move is within the grid. The updated position is held in temporary variables during a checkup that the user isn't trying to move into a blue square.

3000-3999 paints the new square color, moves the place marker and updates the STAT(X,Y) values if the move

*You can't move
into a square
that's already
blue—and
you don't know
if it's red
or blue until
you remove the
white covering.*

is valid. If not, the computer beeps and saves the old values.

5000-5999 flips the board. We save time by redrawing the board as we flip the squares.

6000-6999 draws the gameboard.

7000-7999 is the opening menu.

10000-10999 randomizes for new game.

11000-11999 initializes. 

Heidi Brumbaugh joined the Antic editorial department a year after graduating from Grinnell College, Iowa where she majored in Russian language. After taking a few programming courses, she became a fixture in the computer center until they felt so sorry for her they gave her a job as a user consultant. We promised Heidi we'd publish this first submission (originally titled Pathfinder) as the July Game of the Month if she let us change the title—and the game colors—to a suitably patriotic Red, White and Blue.

ing it with TYPO II. ENTER it into HOUSE01.BAS from last month to make use of the things we have learned so far. Save this version as HOUSE02.BAS. If you have trouble typing the special characters in lines 110 and 150, Listing 2 will create these lines for you, and write them to a disk file called LINES02.LST.

HOUSE animates by printing modified #, \$ and % characters, all in the same spot on the screen.

Line 110 contains the memory move routine from above.

Lines 140 and 150 place the data for three new characters into a string called (naturally) "CHARSET\$".

Line 160 saves the RAMTOP value

Line 170 sets the character base, CB, at 4 pages or 1K down in memory.

Line 180 safeguards RAMTOP by lowering it another 1K below the character set.

Line 190 uses the MM\$ routine to move the 1,024 bytes of the character set from its regular place at 224 pages to the new location 1K down in our safe area.

Line 200 moves only the 24 new bytes in the character string into the old set we just moved into RAM. It is placed into the set starting at the third character, because NCA, which is the starting point for this move, is 24 bytes or 3x8 past CA, which is the start of the whole set. Translated into English, the first eight numbers starting at CA are the first character, the next eight the second, and so on.

Line 2000 tells the computer the new location of the character set data and will switch character sets instantly. Now we need Proto.

Lines 2010 to 2080 simply print our modified characters on the screen, using #\$\$% over and over again with their new data.

Finally comes a loop to slow down our frisky friend Proto.

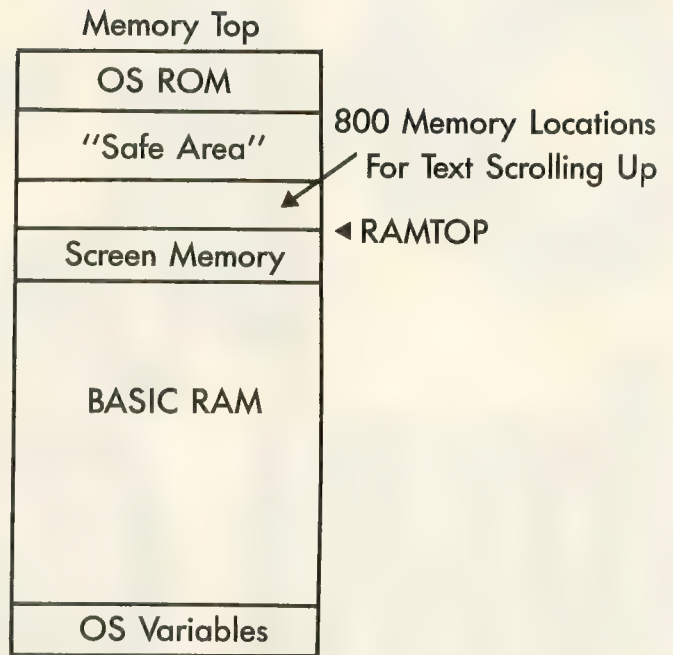

MORE PROTO

Our pal is pretty small and doesn't move around much. After all, Proto is only one character tall. But we can make him larger by using several characters to draw him on the screen.

Type in Listing 3, HOUSE03.LST, checking it with TYPO II. If you have trouble typing the special characters in lines 2110-2120, Listing 4 will create these lines for you, and write them to a disk file called LINES03.LST.

HOUSE03 adds some new lines to the program and enlarges Proto. Be sure and type in the REM statements, because they blank out old line numbers that are no longer used. You ENTER the code while HOUSE02.BAS is LOADED into your Atari. SAVE this version as HOUSE03.BAS.

Line 100, the delay loop, has been moved to the front of the code. This is because timing loops take longer to run the further back in the code they are. BASIC always starts each loop by going to the top of the code and searching for the lines it needs. Placing it here will keep the timing the same as the program grows.

Lines 150, 160, and 180 delete the old lines in the last version of the program. If you're typing this in, you can delete the old lines simply by typing the line number and pressing [RETURN].

Line 200 places the new shapes, starting at character 96 in the set—abcdefghijklmnopqr. The other trick in this line involves SEC=0 to 1. This and line 210 place two strings into the Proto character. The second set of data starts 76 bytes into the data. The two sets allow us to keep our strings short. You can do this several ways, but you can't have 300-character strings all on one line. I could have had line 2120 say CHARSET\$ (77,152) = "whatever goes here" to define the string.

2000 to 2060 work as usual, we just print three versions of the little guy using more characters this time. Here are the three versions of Proto:

VERSION 1	VERSION 2	VERSION 3
ab	gh	mn
cd	ij	op
ef	kl	qr

Of course, we have given these letters new shapes of a more artistic nature.

The most interesting change we've made is to store the shape of the characters in a string called CHARSET\$. It is efficient because each number (like 240) previously stored in a data statement is now stored in one number. Those are the characters you see in the string.

A simple way to check the progress of your work with custom characters is to stop the computer after you think you have changed the characters. Now press the keys you

ONE TWO PUNCH IN ATARI COMPUTING

Whether you own an 8-bit Atari computer or one of the new STs, you need the power of a magazine designed especially for you.

FOR THE 8-BIT ATARI AND ST USER

ANTIC, the Atari Resource, the leading Atari publication for five years, is still the undisputed champion. Every month it delivers powerful articles, knock-out programs, and punchy product reviews.

To save you all that tedious typing, Antic will supply you with a monthly disk for your 8-bit, chock-full of useful programs, great games, and utilities.

Subscribe to **ANTIC**, the Atari Resource, and win! Twelve times a year, **ANTIC** shows you how to get the most out of your Atari, and have fun, too. A full year of **ANTIC** (12 issues) is just \$28. Or treat yourself to the Action Edition (12 issues plus 12 disks) for \$99.95.

JUST FOR THE NEW ST

START, the ST Quarterly, is the leading contender in the ST field. A trailblazer, **START** gets the points for its indepth reviews, challenging tutorials, and inside tips from the biggest names in the Atari world.

Every issue contains a 3 1/2" disk packed with amazing programs and utilities that will simply knock you out with their convenience and power.

Pick the winning combination by subscribing to **START** plus **ANTIC**. For just \$59.95 receive four issues of **START** with disk plus twelve monthly issues of **Antic** with its invaluable ST Resource section. Stay up-to-the-minute with new products, new developments, new programs, new information.

Or subscribe just to **START**, the ST Quarterly for only \$39.95

Chicken XL

A Stan Ockers classic returns

PROGRAM BY STAN OCKERS
ARTICLE BY ANTIC ED

Chicken is a smooth "Frogger"-type game that originally appeared in the first issue of Antic. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.

We're proud that so many readers have been with us for the entire five years of **Antic** Magazine's publication. However, most people discovered Atari computers and **Antic** considerably more recently. Now you won't miss out on the classic programs from **Antic's** early years. Our newest department—the **Antic** Hall of Fame—will reprint outstanding programs from the issues we published five years ago.

Actually, the Hall of Fame will do more than simply reprint classic **Antic** programs. Without changing anything about the way these programs look or run, we will re-edit the listings to ensure that they work on today's XL and XE models—and also to ensure that typing them is made as easy as possible.

It's a pleasure to begin the Hall of Fame with Stan Ockers' *Chicken* from April 1982, the very first issue of **Antic**. Though now less active than he used to be, Ockers is probably the best known and most prolific programmer of Atari public domain

games. He still lives in Lockport, Illinois, but his games usually premiere in the newsletter of the Eugene (Oregon) ACE. He has resisted offers to turn pro and gives all his games to public domain, refusing to accept payment for them.

Ockers' smooth, inventive games are state-of-the-art Atari BASIC and highlighted this magazine's early is-

sues. His last appearance in **Antic** was *Crickets*, September 1985. Games by Stan Ockers can be found on no less than four public domain disks from The Catalog. (PD001, PD003, PD004, PD005. \$10 each.)

Other public domain programmers have tinkered with the original *Chicken* listing. So unfortunately many current versions do not work correctly on the XL/XE computers. However, the listing published in this issue is the "pure" version that Ockers recently sent us at our request, and it works just fine on the XL and XE.

CHICKEN REVISITED

Type in Listing 1, CHICKEN.BAS, check it with TYPO II and SAVE a copy before you RUN it.

This gem was a clever BASIC adaptation of the popular "Frogger" format. What follows is the original 1982 text for *Chicken—A Great Game*:

Why did the chicken cross the road?

To lay an egg.

Actually, our chicken is trying to score points by getting safely across this busy highway. Each time he makes it adds to his score, but the cars go faster and faster. If he gets hit, the SPCA sends an ambulance and the cops slow the traffic for a while. ▣

Ghost Writer

Transmit your own subliminal messages

BY TOM MOORE

Ghost Writer lets you experiment with subliminal messages on your Atari—anything from “Feed Spot” to “Feel Good” to “Use TYPO II.” Just don’t use the power of subliminal text to influence your friends with sneaky messages such as “Buy Lunch.” Ghost Writer’s influence should only be used for positive-thinking, self-improvement messages. This BASIC program works on all 8-bit Atari computers of any memory size, with disk drive.

Warning: the Ghost Writer program makes USSR calls to the spirit world. Not only that, techniques of subliminal suggestion are employed and *you* could be subconsciously influenced.

But if you’re brave enough, douse those lights, lean back and commune with another world via your Atari. Ghost Writer works best from a distance and with the lights out. Try to get a *black* background on your monitor or TV.

Ghost Writer calls the spirits randomly—and it seems that insulting, obnoxious spirits are the most prevalent. . . “Here—we die,” said the Ghost Writer. “Profound,” I thought. Then came a couple of screens of gibberish. Then “Kiss—Moi” (A French ghost?) and suddenly I had this crazy urge to go jogging—so I did.

What’s going on here? Actually, those random phrases that Ghost Writer flashes over the flickering screen patterns are just a coverup for your secret subliminal message.

For a while during the ’50s, use of subliminal messages was a hot controversy. Subliminal messages are flashed on film or TV so fast that the eye doesn’t consciously notice them—but the brain gets the message anyway. People were worried that unscrupulous advertisers or politicians would use the hypnotic power of subliminals to control the minds of

citizens.

As it turned out, subliminal messages weren't all that effective. A couple of low-budget horror movies used subliminals as a gimmick, but drew more giggles than shivers. However, there were also occasional tantalizing reports of successful experiments. For example a movie theater snackbar was supposed to have increased business substantially by flashing subliminal messages like "Eat Popcorn" and "Drink Cola" during the films.

Ghost Writer lets you experiment with subliminal messages of your own writing. Ghost Writer's influence is best applied to "self help" sayings such as "Be Positive" or "Make Sure." Don't misuse the power of subliminal text to bombard your friends with sneaky messages such as "Buy Lunch."

I've tested Ghost Writer on several unsuspecting friends and they found the spirits' ramblings surprising. More surprising, however, was my friends' unconscious desire to do something. Even when pointed out, the message still has impact—watch what you say.

GETTING STARTED

Type in Listing 1, GHOST.BAS, check it with TYPO II and SAVE a copy to disk. Next, type in Listing 2, GHOSTA.BAS, check it with TYPO II and SAVE a copy before you RUN it.

When RUN, Listing 2 creates a file called GHOST.FNT, the special character set used by Listing 1. (Antic Disk Subscribers will find GHOST.FNT on the monthly disk).

Keep GHOST.BAS and GHOST.FNT on the same disk. To use the program, simply type RUN "D:GHOST.BAS".

ABOUT THE PROGRAM

TOM\$ and MOT\$ contain your message, located in line 1220. The strings are dimensioned at 20, so you could have a message that's 40 characters long—but it would look a bit shoddy. Short messages (four letters or less) are picked up most effectively by your subconscious mind. To center the message you'll have to use words or sentences that contain an even number of letters and spaces.

Afterimage

Tricky Atari optical illusion

BY NICK KOZIUPA

Afterimage is a short listing that tests a simple but interesting optical illusion. Most users will apparently still "see" an image after it has been removed. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.

One day my biology teacher showed the class how an image—such as the bright glare of a flashbulb—can be temporarily "burned" into the retina of the eye. So that after the image has been removed, you

can apparently still "see" it. I decided to try demonstrating this effect with the graphics of my 8-bit Atari computer.

Type in Listing 1, AFTERIMAGE.BAS, check it with TYPO II and SAVE a copy before you RUN it. When you RUN the program, you'll see a brief title

screen and be asked if you need instructions. Press either [Y] or [N].

Now you'll be prompted to choose a color and a shape. The screen then turns white and the shape appears at the center. Concentrate on it and try not to blink. In about 15 seconds the shape will leave the screen. If the test works, you'll still see it—but in the opposite color. So if you picked a red square, you should now see a green square in its place. After several seconds, the program returns to the color selection menu. ▣

Nick Koziupa is a high school sophomore in Hamilton Township, New Jersey. He has been programming on his Atari for three years.

Listing on page 91

READING IS NO LONGER A SPECTATOR SPORT.

If you think interacting with a publication means turning pages, we invite you to discover something altogether different. A brand new publication on disk.

Like a magazine, it comes out bi-monthly and it's filled with everything from editorials and fiction to reviews and humor. But unlike a magazine, it lets you talk back.

You can influence the outcome of stories. Demonstrate new software products. Or tackle a brainteaser. There's something for everyone. From the novice to the experienced user.

Never before has a publication come to life with such animation, color and sound. We call it Aladdin. You'll call it magic. Available for Atari and Amiga Computers.

To get your hands on a copy, call collect 214-788-4441 for the dealer nearest you.

The New
Aladdin

CIRCLE 002 ON READER SERVICE CARD

ing the [*] and the [!] and their [CONTROL] key equivalents for the most radical changes in the appearance of the writings. I used Envision (\$15.95, The Catalog, APO185) for my character creating, but other character editors such as *Ultra Font* (Antic, August 1986) will work just as well.

For a different look, try this: Hold down the [SELECT] key when you

*With Ghost
Writer, be careful about what
you suggest.*

type RUN. When the Ghost Writer screen appears, press the [BREAK] key to stop the program. (Programmers Note: GHOST.BAS uses a fairly common DEBUG routine. Holding down the [SELECT] key activates this routine and lets you use the [BREAK] key. When the DEBUG routine is not used, the [BREAK] key is disabled.)

Once the program is stopped, type something such as ? FRE(0), or ? TOM\$. Press [RETURN] and then type RUN. You can repeat this procedure until you get a spirited lock-up. (Make sure the program has been SAVED to disk before you try this.) Once the spirits lock up your computer, even an exorcism can't help it. Time to reboot.

If you own a BASIC compiler, give it a spin. The speed of events is critical, so you may have to tinker with lines 2430 and 2440 to achieve the speed that works. Simple delay loops are tough, so you might use system timers to cue your subliminal (PEEK 20 and 19). 

Tom Moore is a 31-year-old designer and builder of professional audio/video systems in central Florida. A former pro musician, he is now totally immersed in MIDI and is working on turning his Atari 800 into a MIDI velocity meter for use alongside his 1040ST.

Antic Writer

Full-featured professional word processor

Now for only \$5.95—down from \$10.95—you can get single copies of the Antic Monthly Disk. And each month's double-sided disk will feature an Xtended Disk Bonus not available in the magazine. Usually this bonus program will be software that's too long or complex to work as a type-in listing. Xtended Disk Bonus software may be for either the 8-bit Atari or the ST in any given month—or sometimes even for both.

For our premiere Xtended Disk Bonus, **Antic** is proud to offer a professionally programmed full-fledged *machine language* word processor for any 8-bit Atari with minimum 48K memory—Antic Writer.

Developed by a small commercial publisher, Antic Writer never quite made it all the way to being released in a crowded and competitive software marketplace. In a number of ways, Antic Writer is reminiscent of leading Atari word processors such as PaperClip and Word Magic. It certainly delivers the essential capabilities you'd expect from a professional word processor: block move, search and replace, block copy, headers, print formatting and so on.

Because it is written en-

tirely in assembly language, Antic Writer is *fast*. You'll find that it can keep up with even the fastest typist and not lose any characters.

Antic Writer is easy to operate and provides extensive online help screens. We have also placed the Antic Writer manual on side 2 of the July Disk, along with the Antic Writer program itself. The manual is in two Antic Writer text files—ANT1.TXT and ANT2.TXT. Select option C from the DOS menu to "Copy" these files to P: (your Printer) or E: (onscreen Editor).

You'll find it a lot more convenient

to work with Antic Writer if you copy it off the monthly disk and put it on a separate disk. To make your own Antic Writer disk, start with a disk which has been formatted with DOS 2 or 2.5 and has a DOS.SYS file on it. Next, copy ANTICWTR.EXE to this disk and rename it AUTORUN.SYS. Be sure to make a backup copy of this disk before you use it.

To start using Antic Writer, place your Antic Writer disk into your disk drive, remove all cartridges from your Atari (XL/XE owners should depress the [OPTION] key) and turn on your Atari.

Next month's Xtended Disk Bonus—a professionally programmed, full-featured database!

Special Note to Programmers: If you have high-quality software for the Atari 8-bit or ST that is too big or too complicated for a type-in listing, send it to **Antic** for possible paid publication as an Xtended Disk Bonus. Runtime versions of software in any programming language will be considered. If your program was once turned down here solely because it was too big or too hard to type, you can resubmit it for Xtended Disk

Bonus consideration.

Toronto Atari Federation

Membership zooms tenfold since '84

BY GREGG PEARLMAN, ANTIC ASSISTANT EDITOR

TAF, the Toronto Atari Federation, went from about 40 family memberships in 1984 to 300 by the end of 1986—and then added another 73 families in the first two months of 1987. Lots of Canadians got STs for holiday gifts.

“Our growth rate is normally around 25 members a month,” says Ian Newton, who was TAF’s president until February 1987, when Jim Clark took over. The greatest distance anyone travels to the meetings is about 40 or 50 miles.

“One of the big problems most clubs have is that normal screen size imposes limits on program demonstrations,” says Newton, “so we purchased equipment to project the programs onto a very large screen—about eight feet by 10. This has improved presentation a lot, and we don’t have to use three small monitors. You tap into the video system and it projects right onto a wall or a screen.”

TAF began in March, 1982, with a group of interested Atari users aided by a local software marketing company. Memberships are for the whole family. If a parent joins, the spouse or the children can also join at no extra cost. The average age for individual members is late thirties or early forties. Most members are university graduates and they work in a wide variety of occupations. Less than 5% of TAF members are children, but kids often show up at special functions

such as auctions.

The ST users meet the first Monday of each month, and the 8-bit users meet on the third Monday. Each group has its own vice president. The executive meeting is on the second Monday. About 100 people show up at both the ST and 8-bit meetings. “That’s a large percentage of 8-bit users,” says Newton, “because we only have about 150 8-bit members.” The group’s only SIG is for users of VIP Professional, and while TAF has no BBS, a section of AMCO, a local system, has been set aside for the group.

Newton says that both ST and 8-bit

meetings are always well-organized.

“The first part consists of demonstrations of the latest library disk highlights. There are always at least one or two new disks per month. Then comes a 10-minute break for disk sales, followed by a feature presentation from an outside speaker which normally takes 30 to 45 minutes. Then one or two additional presentations usually take place.”

TAF meetings usually have a featured outside speaker, often from Atari of Canada—General Manager Ian Kennedy or a marketing executive. Atari gives presentations at least three or four times a year. Batteries In-

cluded, being a local company, is always around and Ian Chadwick, author of *Mapping the Atari*, often attends meetings.

Several retailers are active at TAF meetings, supplying free giveaways at raffles, etc. "We have quite good support from our retailers," says Newton. "Some retailers have special deals where if you buy their equipment, you'll get a free membership to our club or a 10% discount. At the raffles, any software we have is freeware or public domain material—no unauthorized copying whatsoever."

TAF FUNCTIONS

TAF is semi-affiliated with several clubs in southern Ontario which they provide with club library disks. "We suggest that an officer of each club become a TAF member also," says Newton. "They can get a copy or two of all our disks and make duplicates for their own club members." TAF also had a booth at the April 1987 Western New York Atari Users Group Atari Fest in Buffalo.

"Mainly, however, we do a lot of swapping of our newsletters—with clubs all over the world," says Newton, "including some in the Netherlands, England, and Australia. On a business trip to Europe, I contacted some users groups for the purpose of ST disk exchanges."

PHOENIX

The TAF newsletter, Phoenix, is usually 28 pages, typeset on the ST with a dot matrix printer and copied at a local printshop. Between 50 and 100 are sold by retailers. In March 1987, Larry Sannuto became the editor. "We're doing a lot more with graphics in the newsletter now, using DEGAS Elite on the ST," says Newton.

SURVEY

Of TAF's 373 family members in January 1987, 219 owned STs, of which 65-70% are 1040s. The 130XE is by far the most popular 8-bit computer used. About 90% of XE owners use Atari 1050 disk drives. Few, if any, members use cassettes anymore.

Almost all TAF members are users, not programmers. In fact, only about 5% program. TAF member James Duffin is the author of *Font Maker* (Antic, March 1985) and he now has a version for the ST.

XE users who do program mostly use BASIC, and ST programmers use ST BASIC, C and Pascal. ST BASIC has a narrow margin over C.

There's no club BBS, so only 15% to 25% of members go online. The most widely used online services are local bulletin boards and then CompuServe.

In order of importance, TAF members use their Ataris for:

1. Word Processing
2. Games
3. Education
4. Programming
5. Business/Finance
6. Communication
7. Other

ATARI ANIMATION

continued from page 33

have modified and see if they print out on the screen with the new shapes. In our example, press the keys in this order:

abc def ghi jkl mno pqr

This should display the different parts of the new shapes we have created. It is easier to look at the shapes this way than to wait for the program to use them. Also, you can study each shape when it is not moving around.

Creating the masterpiece I promised you will take *lots* of custom characters. Figuring out a few shapes for Proto was not bad, but 30 or 40 shapes sounds hard. However, next month we will deliver the tools to make it easy!

Robin Sherer is co-author of the Atari programming books Tricky Tutorials, Master Memory Map For Atari, BASIC Arcade Graphics and Atari Game Design.

How Much Are You Worth?

SynCalc template figures it for you

BY GORDON TOOMEY

How much are you worth? Net worth measures your financial growth and can help you attain desired financial goals. This file gives a projection for the next year, as well as each six-month period for the next two years. I use SynCalc (Broderbund, \$49.95) to update my net worth as of January 1 and July 1 each year. (We could not get this template to work with Calc Magic or VisiCalc. If you come up with a fix, send it to Antic for possible publication. —ANTIC ED)

To figure out your net worth, you need to know the value of your assets, liabilities and, in this case, liquid assets. Net worth is the dollar value of total assets minus total liabilities.

- Total assets = all money and property.
- Total liabilities = The sum of charge cards and other credit accounts.
- Liquid assets = cash in hand. In other words, available money—not including property.

ASSETS AND LIABILITIES

Start out by using your word processor to make a table of your assets and liabilities. *Figure 1* shows the January 1, 1987 table for a fictional couple we'll call Tom and Betty.

Here, "property" includes all personal property—even if it's mortgaged or owned on borrowed money. For example: houses, furniture, automobiles, rentals, and valuable collections such as coins or stamps.

Tom and Betty own a house, furniture, a car and a coin collection. Except for the car, the market value for all this property will remain constant for the next two years. (The market value of the furniture is taken from the fire insurance policy.) Instead of using classified ads or a dealer's blue book, Tom established a car depreciation figure of \$1,000 per year from his past history. The car cost \$10,000 two years ago, and Tom thinks it will last eight more years.

A personal net worth file is a key document in planning your financial future.

If you have SynCalc spreadsheet software and are familiar with its use, you can track your own personal net worth on an 8-bit Atari computer with at least 48K memory and disk drive.

Include the cash value, if any, of all insurance policies. Investments include stocks, bonds and limited partnerships. Note their current value and estimate the percent of increase based on past growth and dividend. Tom notes \$3,000 of JB Inc. stock with a projected growth of 8%.

Miscellaneous accounts are items not covered by other categories. Here, it's a one-year, \$1,000 loan Tom made to his friend Bill at 6% interest.

The remaining items include Not Taxed Accounts and Taxed Accounts—only money earned in the *taxed* account must be reported at the end of the tax year.

Tom has three Not Taxed Accounts: two IRAs (Individual Retirement Accounts), and an account consisting of money contributed to Tom's pension by his employer. Tax on this must be paid upon retirement unless Tom puts it into another IRA. Every six months, \$1,000 is added to each account. Interest averages 8%.

The Taxed Accounts are two savings accounts earning an average of 8%, and a checking account earning 6%.

Once your assets are defined, list your liabilities—credit cards and all loans, such as home, car and rental property. Tom and Betty have a Visa card and two department store cards. Their current Visa debt is \$2,000. Monthly

continued on page 44

FR ER TH

payments are \$80, and interest on the unpaid balance is 19%. Each store card charge totals \$1,000. Monthly payments are \$30 and interest is 19%.

Tom also has a one-year, \$1,000 bank loan at 14.8% interest. He just applied for this loan, and is making the first payment. Tom's car loan is \$8,000 at 12% interest for 48 months, and he's in month 24. The \$75,000 house loan, 30 years at 10% interest, is in month 80.

Now we'll enter this raw data into SynCalc and generate a personal net worth file. This article assumes that you already know how to operate SynCalc software. For instance, you should know that pressing [OPTION] starts a command sequence, how to move around within the spreadsheet, etc. Keep your SynCalc manual handy!

Antic Disk owners will find two complete templates on the monthly disk under the filenames NETJAN.SC and NETJULY.SC. You'll need to boot SynCalc before loading either of these files.

TYPING THEM IN

Even if you're a SynCalc whiz, please pay close attention to these instructions—and carry them out in the exact order printed here. There is difficult typing ahead, with no TYPO II to help you.

Immediately after booting SynCalc, place a blank disk into your drive. Format this disk using the **FORMAT** function from the **LOAD/SAVE** menu. (Don't use the **FORMAT** function from the **COMMAND** menu!) Next, set all your column widths to seven. Press [ESC] to remove the command bar and type: /FGW 7

Now, type /FGP 2 to set GLOBAL FORMAT PRECISION to two. When the PRECISION function is set this way, all of your dollar values will be rounded to the nearest cent.

Type /FG, to enable the COMMAS function. When chosen, this function will insert commas in numbers like 1,000. Next, type /RM to enable the GLOBAL RECALCULATE MANUAL command. This function speeds data entry.

Type /FL A1:A255 to justify your entries in column A against the left margin. Type /FR F1:H255 to justify your entries in columns F through H against the right margin. Finally, type /RR to set calculation to ROWS.

You're now ready to type in the spreadsheet information. Copy the text headings shown in *Figure 2* into column A of your net worth template. If a title exceeds seven characters, type it in anyway—SynCalc's overflow feature handles the over-long material automatically. (But you need to erase each overflow cell manually if you move the title.)

Figure 2 shows a completed NETJAN.SC template that gives you Tom and Betty's net worth, total assets, total liabilities and liquid assets on January 1, 1987 and as projected for every six months during the next two years.

This Tom and Betty sample file is intended simply as a guide that you can adapt to your own situation!

You must enter all numbers and formulas in the *exact cells* shown, or else the template won't work. Enter zeros in columns B to E to "hold open" the cells for formulas and values to come later.

Listing 1 shows each cell address, followed by the entry. *Don't* type the cell addresses (such as D7) shown in the first three or four spaces at the left. Instead, type /Gcellname to go to that cell. /GD7, for example, puts your cursor at cell D7. Once you're at the cell, type in the formula, typing over the space-holding zeros entered earlier.

A formula element like E17 is not text—type it as +E17 so that SynCalc will know it's a numeric entry. As you enter each formula, protect it by typing /FO (FORMULA PROTECT ENTRY) so you won't accidentally write over it.

TOM AND BETTY

Enter Tom and Betty's yearly interest projection in cell D4. Try changing the interest rate and seeing the impact of a new projection. Tom shows 8%, based on a review of the interest data in *Figure 1*—six line items of 8%. Tom could also enter the three credit card interest rates (19%) into nearby cells. Next, enter the *Figure 2* loan data between cells D6 and F14. If you have more loans than shown in the example, just repeat the procedure until you're done.

After typing in the text as shown in cells D6 through

Figure 1

ASSETS AND LIABILITY DATA CURRENT AS OF JANUARY 1, 1987

ITEMS	CURRENT VALUE	REMARKS
ASSETS		
Property		
House	100,000	Constant Market Value
Car	8,000	Depreciates 1,000/yr
Furniture Etc	8,500	Constant Market Value
Coins	1,000	Constant Market Value
Insurance		
Person A	4,000	Constant
Person B	2,000	Constant
Investments		
Stock	3,000	Increases 8% per year
Misc. Accounts		
Loan	1,000	1 year loan at 6%
Not Taxed Accounts		
IRA A	6,000	Adds 1,000 @ 6 mts at 8%
IRA B	4,000	Adds 1,000 @ 6 mts at 8%
Co. Pension	30,000	Adds 1,000 @ 6 mts at 8%
Taxed Accounts		
Bank A	5,000	Adds 1,200 @ 6 mts at 8%
Bank B	2,500	Adds 1,000 @ 6 mts at 8%
Checking	950	Value plus 6% is constant
LIABILITIES		
Visa card	2,000	Pay 80/mth @ 19% interest
Dept. Store A	1,000	Pay 30/mth @ 19% interest
Dept. Store B	1,000	Pay 30/mth @ 19% interest
Bank Loan	1,000	1 yr at 14.8% at pay # 1
House Loan (\$75,000)		30 yrs at 10% at pay # 80
Car Loan (\$8,000)		4 yrs at 12% at pay # 24

D14, Tom enters "house" in the adjoining cells under column E. The loan is the initial amount borrowed (\$75,000). The interest is entered as a decimal (0.10). Enter the number of monthly payments (360) and type the current payment number (80) in the line below.

The monthly payment amount (PAY/MONTH) goes in the cell below. Tom used this formula for the monthly payment of the house loan in cell B9:

$$B5/((1+(B6/12)^{-B7})/(B6/12))$$

(The $^{-B7}$ is not a misprint. It means you're raising the value of B7 to a negative power. This is the same as $^{(1/B7)}$.—ANTIC ED)

For the car loan, use B12, B13 and B14 instead of B5, B6 and B7. The last item, cells B10 and B17, is the interest rate factor. Here's the formula for B10:

$$((1+B6/2)^{(1/6)-1})$$

For B17, substitute B13 for B6 in the formula.

Rate factors for the other loans are calculated the same way. Just make sure that the cell letter is the same as the column letter for that particular loan.

Now enter the current value data for assets and liabilities. Move to the equivalent of row 24 shown in the example. Enter the *text* data in column A from the data you generated that is *similar* to Figure 1. Do the same for column B. Remember, when compiling the asset and liability data, we calculated the current value for the house and car loans while preparing the net worth file in Table B cells B49 and B50.

Tom used this formula for his house and car loans. (The house loan is in column E and the car loan in column F):

$$B9*(1+(B6/12)^{-B7+B8})/(B6/12)$$

The house and car loan equities are easy to calculate. The loan equity equals the amount of the loan minus the value of the above formula.

PROJECTED DATA

Move to the equivalent of cell C24 in your file before inserting the projected data shown in columns C through F. Figure 1 indicates a constant market value for the house, furniture, coins and insurance for both Betty and Tom, so he copied the cell B24 current house value into cells C24, D24, E24, and F24 by typing B24 into each of these cells. If cell B24 is changed, all corresponding cells to the right of B24 would change also. Tom also did this for furniture, coins and insurance.

Due to car depreciation, the cells to the right of B25 were treated differently. In Figure 2, Tom entered the value B25-500 into cell C25, C25-500 into cell D25, D25-500 into cell E25, and E25-500 into cell F25. Therefore, each cell reflects a depreciation of \$500 compared to the cell to the left. A change in cell B25 instantly revises all neigh-

boring cells.

To accommodate the constant 8% annual interest for JB Inc. stock, Tom entered the following formulas into cells C30, D30, E30 and F30:

$$B30*(1+C4/2)$$

$$C30*(1+C4/2)$$

$$D30*(1+C4/2)$$

$$E30*(1+C4/2)$$

Bill's loan was handled differently: the interest was deducted from the initial loan at the start (\$1,000-.06*1000), and the balance (\$940) was divided into 12 payments of \$78.33 each. Therefore, Tom entered 940 in cell B31, B31-(940*6/12) in cell C31, and C31-(940*6/12) in cell D31. The zero in D31 means the loan has been paid, so he entered zero into cells E31 and F31.

The values in rows 35 through 39 all use the same formula—except the identification of the row number of each cell is different. For cells C32, D32, E32 and F32 the formulas are:

$$(B32+1000)*(1+C4/2)$$

$$(C32+1000)*(1+C4/2)$$

$$(D32+1000)*(1+C4/2)$$

$$(E32+1000)*(1+C4/2)$$

The cells in row 35 are handled as above, except 1200 is used instead of 1000 because of the difference in the amounts deposited every six months. The checking ac-

continued on next page

count entry is $B37 * (1 + 0.06/2)$ for cells C37, D37, E37 and F37.

The assets data is completed after entering the the *assets* (the sum of the columns from row 24 through row 37: @SUM(B24:B37)) and liquid assets (the sum of columns from rows 32, 33, 35, 36 and 37).

The formulas used to calculate the projected six months for the Visa and two department store accounts is lengthy. Since the net worth file indicates trends and doesn't have to be accurate to the nearest dime, Tom used this formula:

$$(B - (P * 6)) * (1 + R/2)$$

B is the balance shown in the cell to the left, R is the interest rate and P is the monthly payment. For example, cell C49 says:

$$(B46 - (30 * 6)) * (1 + .19/2)$$

Tom's formula for the cells showing the bank loan projection is the *balance shown in the cell to the left minus the amount paid each month*. It's calculated like this:

$$1000 - (.148 * 1000) = \$852.$$

Put 852 into cell B48. For cell C48 this is $B48 - (71 * 6)$, and for cell D48 this is $C48 - (71 * 6)$.

Since Tom didn't have the current balance for the house and car loans (see Figure 1), he calculates the current balance and projected value for them. Here's the formula for cell B49:

$$B9 * (1 - (1 + B6/12)^{-B7 + B8}) / (B6/12)$$

B8 shows the current payment number of the house loan. For cell C49 this value is $B8 + 6$, since it's for a time period six months later. For cell C49 the above formula is:

$$B9 * (1 - (1 + B6/12)^{-B7 + B8 + 6}) / (B6/12)$$

For the automobile loan, use row 50 and replace B5 through B10 with B12 through B17.

Finding the sum of the liabilities is like finding the sum of the assets. Here, it's the sum of all of the columns from rows 45 through 50.

You'll finish the net worth file after entering the formulas into cells I29 through I48. Enter total assets into cells I34 through I38 (@SUM B39:F39). Also, enter the total liabilities and liquid assets from the cells in rows 40 and 52. Finally, enter the formulas into cells I29 through I32. For example, into cell I29 enter the formula for the current net worth: B39-B52. This logic applies to the remaining net worth cells; total assets minus total liabilities for the same time period.

UPDATING

Every attempt was made to make sure each cell uses the data in the cell to its left. This simplifies the updating of

the net worth file. For example, when a value in column B is revised, the remaining cells in that row change automatically.

For example, Figure 3 shows NETJULY.SC, the updated file for July 1, 1987. First, Tom changes the current date shown in cells I29, I34, I39 and I44 to JUL 1, 1987. Next, he adds six months to the current loan payment number for the house and car loans (shown in cells B8 and B15) to 86 and 30 respectively.

Then Tom revises the dates shown in rows 22 and 43. Column B reads "PER 7/1/87". Six months will be added to the remaining columns so that "PER 7/1/87" will appear in column F.

The projected data for 7/1/87 shown in column C is revised and compared with the actual value for this date. For example, the current value of the house remains the same, as do the values of the furniture, coin collection and both insurance policies.

The new value for the car, \$7,500, goes in B25. All remaining cells in this row reflect this new data input. The JB Inc. stock does a little better than Tom predicted, let's reset its value at \$3,285. However, since Tom believes that the projected 8% interest is still valid, he puts 3285 into B30.

Bill's loan repayment proceeds on schedule, so Tom types 470 into cell B31. The IRA accounts, company pension, and bank accounts are at the projected values, so Tom enters the values shown in cells C32 to C36 into the

It is strangely satisfying to use an old Atari 800 with more memory than a 1040 ST. In truth, **RAMcharger** extra memory has limited utility, but it warms the heart to know that it is there.

Because the 8-bit Ataris can't use all this memory directly, 16K blocks of memory are switched around to fool the computer. Most programs are not designed to play this shell game and can't use the extra memory. For this reason, most people configure the memory upgrades as an imaginary disk drive—a RAMdisk. The RAMdisk works just like real disk drive—only bigger and much faster. Oh yes, the RAMdisk also forgets everything as soon as the electricity stops, so copy your files to floppies before you switch off.

Bulletin board system operators will enjoy using a one-megabyte RAMdisk with over 8,000 sectors. So will programmers who work with compilers and macro assemblers—a huge RAMdisk speeds development very nicely. People who own a lot of unprotected programs will load their mega-RAMdisk and never turn off the

computer—using RAMcharger as a very fast hard disk. Imagine, load any program instantly.

A few commercial programs will accept the extra memory as a larger workspace. Among them are SynFile+ and SynCalc, which will use about 288K. PaperClip 2.0 will use

320K on the XL and XE only. Magna includes a patch to let AtariWriter Plus use 48K. If you have a third-party DOS, it will probably use some or all of the extra memory as a RAMdisk. MYDOS is included in the package and can utilize all the installed memory. Atari XL and XE computers will let you use BASIC XE with a RAMdisk.

The Atari 800 expansion is Axlon compatible. The XL and XE expansions are 130XE compatible. The ST expansion is, of course, compatible with the 1040ST. The XL, XE, and ST modifications require that you send your computer to the Magna factory. I tested the 1Mb unit for the 800. That gave my computer 1032K total memory, 32K more than a 1040ST.

This 1Mb upgrade for the 800 consists of one board which plugs into the middle 16K RAM slot under the top lid of this Atari model. The RAMcharger can be surrounded by standard 16K boards or a modified 32K board and the BIT-3 80-column card. The 1Mb board is packed with piggybacked chips and it's a tight squeeze. Don't let the exposed wire

on top of the chips touch the board in slot three. A simple 3×5 card will keep the boards safely separated.

The board I reviewed is very well designed and meticulously assembled, using the highest quality parts (tantalum capacitors, 5% resistors, gold-plated connector and switch). Power is drawn from the 800's almost unused 12VDC bus. An on-board regulator reduces it to 5VDC for the chips. A switch will turn off the expanded memory for any program which requires an unmodified machine.

It is unfortunate that thousands of copy-protected and autoboot programs will not run from a RAMdisk. This limits the practical value of these memory expansions. I would love to load all my favorite programs into a vast RAMdisk and never boot my system again. But life doesn't work that way. If you have any use for an 8-bit Atari computer with a vast amount of memory, Magna's products are an excellent choice. Their production quality is first rate.

BDT SHEET FEEDER

Shortly after upgrading my old Epson FX-80 to letter quality I took a look at the tractor paper I was using. Even with laser-edge paper, I still had to rip the tractor edges off after a printing session. And I practically had to tear apart the printer just to use my own letterhead. There had to be a better way, I figured, than just hand-feeding single sheets of paper.

Then I discovered a relatively inexpensive
continued on next page

Product Reviews

pensive (\$189) sheet feeder for my printer. BDT's ad listed sheet feeders for the Epson FX-80+, FX-100+, FX-85 and upgraded FX-80/100 printers. "The perfect solution," I thought, as I eagerly placed an order.

When the **BDT Sheet Feeder** arrived, I was already prepared for installation with a couple of screwdrivers. To my surprise, the unit simply snapped into place. It looked like this would be easier than I thought.

I was wrong. The instructions were a disaster. The "operator's manual" devoted a whole page to the normal printer DIP switch settings (of which only one has to be changed). But it didn't even mention how to assemble the front panel of the sheet feeder.

The manual went into depth on what thicknesses of forms the printer would take, but it never once mentioned how to load paper. After explaining that paper must be fanned to get air between each sheet, it simply says "Load paper." Luckily, this proved to be no problem. Simply place the paper into the input tray and push back on the tray to let the paper fall into place.

The feeder is actually simple enough for anyone to install and use. It was also styled to match the printer, so it looks like an original component—a nice touch.

Now came the important part—the performance test. I loaded AtariWriter Plus for a test run, ran a few single test sheets, then loaded the feeder with my finest letterhead and ran a mail-merge form letter. As I watched, the first copy effortlessly ran through the printer and came to rest in the output tray. "Not bad," I thought, and I left the computer to its business.

When I returned, I discovered something that, once again, the manual failed to mention. With the printer in sheet feeder mode, the page length is 60 lines, as opposed to the normal 66. Each succeeding sheet printed was six lines higher than the last.

While all I had to do was change the page length in AtariWriter Plus to 120 instead of 132 and the top margin to 2, I had still wasted quite a bit of paper.

But aside from the inadequate manual, I enjoy the convenience of my BDT Sheet Feeder. I use copier paper for normal printouts—at about one-third the cost of laser-edge paper. For someone who prints a lot, changes paper often and would like to use single sheets, the BDT Sheet Feeder is a must.

USA CONSTRUCTION SET

If it wasn't for the USA Construction

Set, I might never have known that North Carolina's state motto is "To be, rather than to seem," or that there's a marble quarry in Proctor, Vermont.

For just \$9.95, the USA Construction Set gives you a program disk, plus two data disks that each contain files full of questions for half of the states. The files can easily be edited and enlarged, so you'll have a constant variety of questions to be answered.

In the upper half of the screen, the game quickly draws the outline of the state you've selected. But the rest of

the action takes place in the lower half, so graphics don't really play a major part in the game.

The questions themselves are a problem, however. EZuse's earlier Quizmaster Construction Set (reviewed in *Antic*, November 1986) gave multiple choice quizzes, but the USA Construction Set does things differently. Each question has only one possible answer and you must use the joystick to select from *all* the answers in the file. Suppose you choose a quiz on New Mexico and the question is "What is the state capital?" All you need to do is move the joystick up or down, and when "Santa Fe" appears press the fire button.

The problem lies in the fact that a 20-question file has 20 answers total. After you've answered one question, you eliminate the need for one answer — unless the file has two questions which could be answered with "Santa Fe."

The upshot is it's not difficult to figure out that the state capital of Wisconsin is *not* May 29, 1848, the state flower is *not* "On, Wisconsin," and the state tree is *not* Milwaukee. Once you've got all the "nots" out of the way, the correct answers aren't hard to find. The quiz becomes more like a matching test.

What's good about the USA Construction is that you'll learn something from it. There are plenty of history and statehood buffs who don't necessarily know the date of admission for Rhode Island. And the USA Construction Set is a good source of such information. Younger students should enjoy the sights and sounds, and they can learn as well.

However, if you decide to add to a file, it will take considerably longer to find a right answer in a sea of wrong ones. Can you imagine a file containing 1,000 questions and answers instead of the 20 provided? Possibly the game should have an option to type in the correct answer if you know it offhand. 

YOUR NET WORTH?

Secrets of AtariWriter Plus

Get more power from this word processor

BY CAROLYN HOGLIN

After you succeed at getting AtariWriter Plus fully configured to the specific needs of your own hardware system, using this fine word processor becomes a real joy. Everything works exactly as it should, characters are never dropped, and search-and-replace is so vastly improved over the original AtariWriter that it alone is almost reason enough to purchase the new software. Maximum file size is limited if you're not using the 130XE computer, but the chaining feature works very well and pretty much makes up for this.

Here are the most important things I needed to learn about AtariWriter Plus through my own personal experimentation. (*Please note that Antic doesn't have the hardware in-house to test all these specialized tips prior to publication. Let us know if you find any fixes necessary.*—ANTIC ED)

DOUBLE DENSITY

I wasn't so excited about AtariWriter Plus when I first tried it. I was disappointed to find it was on a copy-protected disk with Atari DOS 2.5. Since I have double-sided/double-density drives, I naturally like to use them to their fullest advantage. What a drag to have all my text files in single-density only. (My drives don't work in enhanced density.) Worse yet, none of my old files in double or

quadruple density could be accessed from the new program.

Then I loaded TOPDOS (configured to be density-wise), put AtariWriter Plus back into drive 1, and binary-loaded (option L) the AUTORUN.SYS file. Voila—the program came up as usual and could now read all my disks. I liked it a lot better already. But this method became a nuisance and took a long time to get running.

Eventually I was brave enough to write a new DOS file to my program disk. (This, of course, voids your Atari warranty, so be warned.) I'm a little suspicious about the DUP.SYS file on the disk, so I didn't replace it but instead wrote DOS.SYS only. In TOPDOS you must also rename AUTORUN.SYS to AUTORUN.AUT. Now everything works as intended, with one exception—I must make certain that my 850 interface is turned off before booting AtariWriter Plus. Apparently the built-in code included in the AUTORUN.SYS file to boot the RS-232 handler is incompatible with other

disk operating systems—no big deal after you realize it.

MARK OF ZERO

I have heard complaints about a bug that makes AtariWriter Plus print a zero in the upper left corner of each page. This *isn't* really a bug. If you have an Epson-compatible printer that does not have a proportional print option (or uses a different escape code for it) and you use the FX-80 printer driver from the program disk, your printer will receive the code to cancel proportional print for each font except Font 3. The FX-80 code is [ESC]-[p] [0]. Your printer may discard the first two characters as a meaningless escape code and then print the 0 as instructed. If you choose Font 3, you might get a 1 at the top of each page.

The solution is to create and use a custom printer driver tailored especially for your printer. My driver for the Epson FX-85 defines all nine fonts and lets me write superscripts and subscripts with [SELECT][UP-ARROW] or [SELECT][DOWN-ARROW], as well as with Fonts 4 and 5. In addition, two-column printing is now accomplished by printing one column and then backrolling the paper for the second one. This does away with certain limitations imposed when both columns are printed together—as is necessary with many printers.

*Get the
most out of
AtariWriter
Plus.*

MARGIN MIXUP

The left and right margin numbers on the Global Format screen assume that the first printer column is 0 and the last one (in picas) is 79. For reasons known only to Atari, the Print Preview feature numbers these columns beginning with 1. If you choose 80 as your right margin, your printout won't be what you expect. The rule is: Your right margin setting must not exceed one less than the maximum number of columns available with a particular font.

If your printer offers elite spacing (12 characters per inch), choose that font and set margins L6, R45, M50, and N89 for an ideal two-column printout.

STRING TOO LONG

The AtariWriter Plus manual doesn't mention an error that pops up every so often: STRING TOO LONG. This aborts your printing or Print Preview with no other explanation. What's happening is that a string of characters somewhere in your file is too long to fit on the line you have defined with your margin settings.

The program considers this string to be a very long "word" and is reluctant to break it up. The string often turns out to be a series of dashes or underlines used in a form of some kind. The solution is to break the string at the end of the lines with a space or a [RETURN]. You can use the Print Preview to check that you did it right.

Incidentally, if you need a continuous blank underline in a form, press the inverse key [] before and after typing the underline. Then your printer will not produce individual underline characters.

And don't forget that you can extend the default of 38 screen columns in the edit mode up to 249 columns with [OPTION] [C]. This lets you set real TAB stops for a chart, for instance, and scroll across the screen while you enter or edit text and make sure that your columns are lined up properly. This sort of editing is almost impossible with a fixed 38-column screen, such as the original AtariWriter had.

However, the scrolling makes for a rather jerky screen, so I use extended columns only when needed. Otherwise I use 40 columns—and always when proofreading.

ESCAPE CODES

The manual suggests that instead of entering escape codes with [CONTROL]-[O] [27], you can hold down the [SHIFT] key and press [ESC] twice. However, the resulting code is not the

*You can use
double-density
files and print
to any printer
—you can
print symbols
you didn't even
know you had.*

escape symbol, but rather the same symbol produced by [OPTION] [INSERT]. When I try to print or Print Preview the file, the program asks me to "MAKE ENTRY, PRESS RETURN." Therefore I stick to [CONTROL]-[O] [27] when entering escape codes for my printer.

If you need curly brackets, use [CONTROL] [;] for the left one and [CONTROL] [CLEAR] for the right. (This *won't* clear your screen.) These keystrokes produce graphic characters on your screen, but the curly brackets will appear correctly on your paper. And have you wondered where to find a lefthand single quotation mark? The [CONTROL] [.] will print this character if you should happen to need it.

CHAINING FILES

When printing multiple-file text, if you attempt to "chain" to files that were prepared on another word processor instead of AtariWriter Plus, you'll probably lose some of your text from the beginning of each file after

the first. Apparently, the program thinks it is stripping off the Global Format commands which, of course, are not present in non-AtariWriter text files. The solution: Load each file into AtariWriter Plus and RE-save it. If it was created with the AtariWriter cartridge, be sure to remove the old formatting line from the top of each file before the re-save.

For some reason, I have not found a way to successfully chain files together using SmartDOS.

TINY FONT

If your printer prints superscript or subscript *font* and can produce 1/2-line spacing, change the S command on the Global Format screen to 1 (or use [CONTROL] [S] for an in-text change). You'll get the obligatory fine print for that contract. Or you can use it to get a lot of printing in a small space—on a disk label, for example.

ATARI 825

If you have an Atari 825 or a Centronics parallel printer and use the built-in 825 driver, you can't get 1 1/2-line spacing by setting S on the Global Format screen to 3, as instructed in the manual. And when you use headers or footers, each page after the first will often begin two lines higher than the previous one.

Here we *do* have a real bug in AtariWriter Plus. There is a code in the printer driver for a 1/2-line feed and carriage return. In the 825 driver the code mistakenly calls for a *reverse* 1/2-line feed. This error causes both problems above. I have successfully fixed it by changing byte \$37 in sector 276 from \$1E to \$1C. (In the 130XE version, the byte to change is \$72 in sector 111.) Or you can make a corrected printer driver for your 825.

If you use the XMM801 and meet similar problems, try changing bytes \$0A and \$63 in sector 495 (byte \$45 in sector 115 and byte \$22 in sector 116 in the 130XE version). Each change is from \$1E to \$1C.

Note that the two versions of AtariWriter Plus require corrections in different locations!

continued on next page

CUSTOM DRIVER

The manual discusses this procedure in detail, but it still doesn't cover everything you need to know to create the perfect driver for your printer.

Use ATASCII code 155 for "LINE FEED AND CARRIAGE RETURN," even if your printer manual tells you something different.

use 1/2-line spacing with the superscript or subscript fonts. Actually, AtariWriter Plus uses this code when printing headers or footers, as well as when printing 1 1/2-line spacing. It may require a trial-and-error process before you get this one right.

You'd think that you should merely add a 155 to whatever you used for the previous "DOWN 1/2 LINE."

Enter the code for 0-line spacing if your printer allows this, followed by code 155, followed by the code for full-line spacing (1/6 inch).

Now for defining your fonts. You must remember that many of the commands are cumulative, so you must cancel the ones you don't want while enabling the one you *do* want. Many Epsoms have a Master Select code that does this to some extent, but I don't recommend using these codes here. They are generally sent to your printer at the beginning of each page and, therefore, will cancel any additional codes for emphasized, etc., that you've entered in your text or enabled through the SelectType push-button feature on your printer.

Figure 1 is my Epson FX-85 printer driver.

On the Epson, italics are not available with near letter-quality (NLQ), so [CONTROL]-[G] [8] produces draft italics. They will look better with NLQ if you also type [SELECT] [.] before and after the italicized words to match the blackness of the NLQ. [CONTROL]-[G] [9] turns italics off, but if you're using NLQ, you must also type [CONTROL]-[G] [7] to re-enable near letter quality.

If you use [CONTROL]-[G] [4] to enter a footnote number (instead of [SELECT] [UP-ARROW]), you must use a [CONTROL] [O] code for your number. For instance if you wanted to enter a reference to footnote 1 and typed [CONTROL]-[G] [4], followed by a [1], the program will think you have asked for [CONTROL]-[G] [41], and will give you an INVALID TYPE FONT error. Instead, type [CONTROL]-[G] [1] [CONTROL]-[O] [49] [CONTROL]-[G] [x] (where [x] is whatever font you've been using). This gives you a raised "1" where you want it. The codes for digits 0-9 are 48-57, inclusive. 

Carolyn Hoglin of Orlando, Florida is a homemaker and former secretary. She was given an Atari 8-bit computer in 1982 and has been programming ever since. This is her first publication in Antic.

DOWN 1/2 LINE	27	74	18					
DOWN 1/2 LINE & CR	27	65	6	155	27	65	12	
CR WITH NO LF	27	65	0	155	27	65	12	
Font #1 PICA	27	112	48	27	84	27	80	18
Font #2 CONDENSED	27	112	48	27	84	27	80	15
Font #3 PROPORTIONAL	27	112	49	27	84	27	80	18
Font #4 SUPERScript	27	112	48	27	80	15	27	83 48
Font #5 SUBScript	27	112	48	27	80	15	27	83 49
Font #6 ELITE	27	112	48	27	84	18	27	77
Font #7 NLQ	27	120	49	27	84			
Font #8 ITALICS ON	27	120	48	27	52			
Font #9 ITALICS OFF	27	53						

Should "BOLD" be emphasized or double-strike? I chose double-strike so that it works with elite and condensed, as well as with pica (but not with near letter-quality).

If your printer cannot do reverse line feeds, be sure to leave the "UP 1/2 LINE" code blank. Entering even a zero here will make it impossible to print double columns correctly. While an entry can be changed, you can't delete it entirely—you must start all over again by rebooting the program.

The trickiest code to define is the "DOWN 1/2 LINE AND CARRIAGE RETURN." The manual says you must define this one only if you intend to

With some printers—the Atari 825, for instance—this *is* what works. With other printers (including the Epsoms), this code produces a 1/2-line feed followed by a *full* linefeed, and it may print headers and/or footers two lines lower on each successive page. And 1 1/2-line spacing becomes 2 1/2-line spacing.

Therefore you must define the code for *setting* 1/2-line spacing (1/12 inch), followed by code 155, followed by the code for *setting* full-line spacing (1/6 inch).

The "RETURN WITH NO LINE FEED" or S=0 isn't needed very often, but I have used it on occasion.

New Products

New Products notices are compiled by the Antic staff from information provided by the products' manufacturers. Antic welcomes such submissions, but assumes no responsibility for the accuracy of these notices or the performance of the products listed.

AWARDWARE

(printing software)
Hi Tech Expressions
2699 South Bayshore Drive
Suite 1000A
Coconut Grove, FL 33133
(800) 848-9273—National
(305) 854-2318—Florida
\$14.95, 48K disk

Print traditional certificates, awards, licenses and announcements, or even coupons, tickets, checks and more with **AwardWare** (\$14.95). **HeartWare** (\$9.95) can help you show your affection for whoever buys you Hi Tech's products. **LoveNoteMaker** (\$14.95) puts your HeartWare on 150 sheets of heart design printer paper and 16 stickers. (This package also contains HeartWare.) **CardWare** (\$9.95, no paper) and **PartyWare** (\$14.95, software plus paper) create festive greeting cards and party announcements for any occasion—and even keep a database of friends and events. **WareWithAll** (\$14.95) is a state-of-the-art paper supply kit with everything you need to print out your creations.

COLLECTOR SERIES UPDATES

(database software)
J.V. Technologies
P.O. Box 563
Ludington, MI 49431
(616) 843-9512
\$34.95 each, 48K disk

The menu-driven **Coin Collector DBS**, **Stamp Collector DBS** and **Photo Collector DBS** (Version 1.1) help hobbyists catalog and store information about their valuable collections. Information regarding 200 records can easily be viewed, sorted, searched or updated any time. Data files, either predefined or user-defined, are easily and quickly accessed, deleted, stored

or expanded.

Also available are the **Coin Gallery** and **Stamp Gallery** templates (\$36 each) for use with VisiCalc and SynCalc—you can create and store records, produce want lists, sell-sheets, bid-sheets and a calendar of important meetings and dates.

UNDERWARE RIBBONS

(printer ribbons)
Diversions, Inc.
505 West Olive Avenue #520
Sunnyvale, CA 94086
(408) 245-7575
\$14.95

You can wear anything you print on your Atari with **Underware Ribbons**. School T-shirts, employee sweatshirts and kites are just a few of the possibilities. Just draw an image on your computer, put an Underware Ribbon in your printer, and print the image on whatever paper you usually use. Then put the paper face down on a T-shirt and iron it—that's all it takes. Underware Ribbons don't damage printheads or irons. Transfers made on fabrics with at least 50% polyester content are permanent and washable. The ribbons last for 20 to 100 shirts and are available in a variety of colors. Multicolor ribbons are available for color printers.

Simple words for powerful packages

Write

TextPro—Wordprocessor with professional features and easy-to-use! Full-screen editing with mouse or keyboard shortcuts. High speed input, scrolling and editing; sideways printing; multi-column output; flexible printer installation; automatic index and table of contents; up to 180 chars/line; 30 definable function keys; metafile output; much more. **\$49.95**

Paint

PaintPro—Express yourself with **PaintPro**, the GEM-based, full-page graphics design package. Multiple windows. Cut & paste between windows. Free-form sketching; lines, circles, boxes, text, fill, zoom, undo, rotate, invert, help. Edit fill and line patterns. **\$49.95**
PaintPro Library #1—hundreds of clip art pictures, 5 GDOS fonts. Fills 3 disks. **\$29.95**

Manage

DataRetrieve—Data management was never this easy! Help screens; lightning-fast operation; tailorable display; user-definable edit masks; up to 64,000 records. Supports multiple files. Includes RAM-disk programs. Complete search, sort and file subsetting. Interfaces to TextPro. Easy printer control. Includes five common database setups. **\$49.95**

New Version

Plan

PowerLedger—A powerful, large capacity (65,000 by 65,000 cells) spreadsheet package that also features a built-in calculator, online notepad and integrated graphics. Displays your data in numerical or graphical format instantly in up to seven different chart types (pie, bar, 3D bar, line, etc.). 14 digit precision with 37 math functions and more. **\$79.95**

Turning the Corner to GFA Basic

Entering a new world of power

By Patrick Bass, Antic Technical Editor

“Let the joyous news be spread: The wicked old witch, at last, is dead.” I recently watched *The Wizard of Oz* again, and when the Munchkin mayor stood before Dorothy and made the above proclamation, I just happened to be sitting at an ST using GFA BASIC. I was struck by how closely his statement paralleled my feelings on the old ST BASIC and brash newcomer GFA BASIC.

Let's face facts. ST BASIC is not a very good implementation of the BASIC language. The windows get in the way, it has trouble with general math and double precision variables, and the editor is a joke, among its other foibles. But BASIC it is, and it *is* given away with each ST, so a lot of people wound up with it, even though they consider it the “Wicked Old Witch”.

NEW KID ON THE BLOCK

Enter, stage right, GFA Systemtechnik, of West Germany. The ST computer is a huge success in Europe, and in West Germany, it's the best-selling personal computer. GFA has written a BASIC which comes closer than anything else *Antic* has seen to being the perfect BASIC. MichIron Software got the North American distribution rights, and it looks like they've made a good choice. In my opinion, it drops a big, big house right on top of ST BASIC and squashes it *flat*.

This month, to show off the advantages of GFA BASIC, I decided to whip up a small demonstration program in both GFA *and* ST BASIC. Longtime *Antic* readers may remember the first C program I published, way back in the August 1985 issue, called *GEM Color Cascade*. It's a small, very simple program, which I've programmed a version of on every new computer and new computer language I've had my hands on in the last ten years. Its purpose in life is to plot a dotted sine wave running from left to right, and plot a cosine wave running from right to left, and then connect the two points.

TYPING IT IN

We have two listings this month. *Listing 1* is the GFA

BASIC version, and *Listing 2* is the same program written in ST BASIC.

If you've got GFA BASIC, double-click on its icon to boot it up and get it running. When the edit screen comes up, type in *Listing 1*, GFACOSIN.BAS, and save a copy of it to disk. (Sorry, we don't have a GFA TYPO program yet.) To try the ST BASIC version, power up ST BASIC, and type in *Listing 2*, STCOSIN.BAS. Check your typing with ST TYPO. If any of the checksums don't match, recheck that line carefully. Both BASIC programs are also located on Side B of the *Antic* monthly disk. Use LinkLine (or some other, more cumbersome method) to shoot the files over to your ST. (If you have any questions about LinkLine, see Side B on the *Antic* disk.)

PROGRAM BREAKDOWN

Take a look at both BASIC listings in the back of the magazine, and compare their structure. Both programs were designed to be as similar as possible.

Right off the bat, you'll notice GFA BASIC doesn't use line numbers. Don't worry—GFA BASIC doesn't need line numbers. In fact, GFA BASIC will choke on any line you try to slip it with a line number.

The top five lines are remarks, describing what the program is and who wrote it. The next small block of code determines the resolution you powered up in, and sets screen limits accordingly. In GFA BASIC, the **XBIO\$(4)** call describes the Atari XBIOS call **Getrez()**, which returns a number corresponding to the resolution we are currently in. ST BASIC performs this with a **PEEK** to **systab**. I also threw a little Boolean algebra in there to shorten the code. Next, below the lines which assign values to **Xres** and **Yres** we assign mouse button bit-pattern values to mnemonic variables.

Now we enter the main loop of the program. Before we draw each display, select a random sine and cosine **Amplitude**, meaning how far up and down on the screen the pattern will get, select a random sine and cosine

ATARI 8-BIT POWER

These products are custom built to work with Atari 400, 800, 1200XL, 800XL, 65XE, 130XE

NEW BOOKS FOR ATARI OWNERS

BASIC TURBOCHARGER NOW for the first time a BASIC programmer can get the power, flexibility and incredible speed of machine language. BASIC TURBOCHARGER is a **book and disk package** that contains over 150 ready to use machine language routines. Complete instructions show how to add them to your own BASIC programs to get these features and more. • Smooth Scrolling • Load & Save Picture files • Special Effects Graphics • Much, Much More • Player/Missile control • Sorting and Searching • Incredible Speed • Over 150 programs Only **\$24.95**

YOUR ATARI COMES ALIVE

SAVE MONEY! Finally an alternative to buying expensive computer add-ons. Your Atari Comes Alive shows you how to **build them yourself!** This "How-to" **book and disk package** gives you complete step by step instructions and programs needed to build and control these exciting devices and MORE. • Light Pen • Alarm Systems • Environmental Sensors • More than 150 pages • Light & Motor Controllers • Voice Recognition • Data Decoders **Your Atari Comes Alive \$24.95**

Atari Software Protection Techniques Vol I & II

These Book and Disk packages detail the most advanced copy protection methods in use today. They guide you through the methods used to create the protection as well as the copying techniques to get around them. They include information on Phreaking • Hacking • On-line security • Black boxes • Self-destructing programs • Pirate bulletin board systems • Logic bombs • New piracy laws • Hardware data keys • Weak sectoring (Phantom, Fuzzy and unstable sectors) • Overfilled tracks • CRC errors • Bank Select cartridges and MUCH, MUCH MORE. The disks include automatic program protectors, Protection Scanners, directory hiding and more.

BOOK I and DISK I
BOOK II (Advanced protection) and DISK II
Special Offer, Order both sets for Only

\$24.95
\$24.95
\$39.95

NEW from Alpha Systems **Chipmunk**

Automatic Disk Back-Up System. Make perfectly running unprotected back-up copies of hundreds of the most popular Atari programs. Chipmunk's sophisticated programming Automatically finds and **REMOVES** copy protection from most Atari programs. Back up even heavily protected programs with ease. Finally, a back-up system that needs no special hardware or skills. **\$34.95**

COMPUTEREYES™ & MAGNIPRINT II+

Turn your computer into a digital portrait studio. This complete package lets you **capture, save & print** digital images from your **Video Camera, VCR or TV**. COMPUTEREYES hardware plugs directly into your joystick ports for easy use. Print your picture on a 6 foot poster **\$119.95**

ComputerEyes camera system
Comes complete with everything above, plus a black and white video camera and connecting cable **\$329.95**

Graphics 9 Software Add a new dimension to your COMPUTEREYES pictures. captures images in 16 shades of grey. **\$12.00**

Magniprint II+ Easily the most powerful print program available today. Print graphics from almost any format in hundreds of shapes, sizes, and shades. Supports **color printing** and lets you create **giant posters**. Magniprint II+ lets you stretch and squeeze, invert, add text, adjust shading and much more. **\$24.95**

Works with EPSON, NEC, Citoh, Panasonic, Gemini, Star, XMM801, and compatible printers (850 interface or equivalent required).

Graphics Transformer
Now you can combine the most powerful features of all your graphics programs. Create print shop icons from a Koala pad picture, from a photo digitized with ComputerEyes, or any picture file. Graphics Transformer lets you **Shrink, Enlarge and Merge** pictures for unequalled flexibility **\$22.95**

PERSONALOR

The hardware & software you need to digitize real world sounds - play them on your computer. Make your Atari speak in your own voice or record and play sounds from a complete orchestra. Play the digitized instruments and sounds from your keyboard, or put them in your own BASIC programs.

PARROT is now being used for special effects by professional musicians. Turn your Atari into a digital sound sampler and keyboard. This package is better than those costing more than twice as much. Everything you need to record and play digital sounds **\$39.95**. Additional pre-recorded sound tracks **\$4.95**/with purchase of PARROT

The Scalyzer
Extract the programming secrets for any Atari program. Scalyzer easily breaks through protection to let you list and study programs. Works with programs on Disk or Cartridge, finds hidden directories, detects copy protection methods and more. **ONLY \$29.95**

ALPHA SYSTEMS 1012 Skyland, Macedonia, OH 44056
Include \$3.00 shp. & hdg. Ohio residents add 5 1/2% sales tax
Foreign orders add \$8.00 shp. & hdg.

Period, which describes how squeezed the pattern appears, select a random color for the display to be drawn in, and choose a Step Size to determine how crowded the display gets.

Next, we start our looping structure which will actually draw the image on screen. Starting on the left side, and continuing across the screen, the program computes the **Sine** and **Cosine** of the current point, plots them, and then connects the two points. Directly after the program draws the connecting line, it runs over and checks the mouse for activity. If the *left* mouse button is pressed, then the program will finish the loop and drop out. If the *right* mouse button is pressed, clear the screen. Then it repeats the loop until the program ends.

CONCLUSIONS

GFA BASIC is a vastly better implementation of the BASIC language than ST BASIC is. For example, notice how clean the mouse call is. While the **ST Resource** will continue to accept submissions written in ST BASIC, if we get the same application written in GFA BASIC we'll probably give preference to the GFA BASIC version. If you've been looking for a more powerful language than ST BASIC, but don't want to move up to Pascal or C, then run, don't walk, and check out GFA BASIC today.

Dr. T's MUSIC SOFTWARE

HAVE YOU SEEN THE DR. LATELY

The Dr. . . . developing amazing new software for the ST!

KEYBOARD CONTROLLED SEQUENCER ST \$195

The ST-KCS contains THREE modes of operation:
TRACK MODE is an automated 48-track tape recorder using the mouse to select ALL major functions. It features a "continuous overdub" function allowing patterns to be built up layer-by-layer in REAL TIME with NO STOPPING! Tracks can be MUTED, UNMUTED, or SOLOED; tempo changed; recording of CONTROLLERS or AFTER-TOUCH toggled on or off; PUNCH points SET and PUNCH-IN and PUNCH-OUTS recorded; and output ECHOED to ANY MIDI channel.
SONG MODE provides 126 sequences which may be recorded on, edited, independently looped, and chained together in ANY manner desired.
OTHER FEATURES include FULL editing of ANY MIDI event or parameter; transposition of velocity, duration, and pitch; auto-correct; inversion, retrograde; extremely flexible CUT and PASTE; and many more edit options. SMPTE is supported through MIDI Song Pointer. A velocity-scaling feature allows easy creation of crescendos and decrescendos. Tracks can be split by synth key-position. STEP-TIME entry functions allow you to painlessly enter parts that you might be unable to play yourself.

THE BATTLE OF 1050 ENHANCEMENTS

HAPPY 1050 VS. DUPLICATOR 1050

	HAPPY	DUPLICATOR		HAPPY	DUPLICATOR
1. How big is the track buffer in your enhancement?	8K	8K	11. Do you provide a Double Density DOS with your enhancement?	Yes, Top DOS. It costs \$39 ⁹⁵	Yes, it is free.
2. Can I give the copies I make with your enhancement to my friends?	Yes, but the newer programs will only run on the Happy drive, so give your original to your friend.	Yes, make as many copies as you want & give them to all your friends.	12. Does your copy program inform the user of the various types of protection encountered while making your back-up?	No.	Yes.
3. What is the size of your operating system?	4K	8K	13. Does your main copy program run in Ultra or Warp Speed?	Yes.	Yes.
4. Do you have the capabilities to make copies of protected disks in D½ or D.D?	No, it wasn't designed in our 1982 operating system.	Yes, it was designed in our 1985 operating system.	14. Do you provide Tech notes for your enhancements?	No.	Yes, we just completed our notes & are now available.
5. If a new form of protection becomes widely used do you have the capabilities to meet this challenge?	No.	Yes, e.g. laser proposed, hardware keys, non-standard density dependent protection schemes.	15. How many upgrades have you done in the past 12 months?	1	4
6. Can programs that require a hardware key be backed up with your enhancement?	No.	Yes.	16. These pre-defined programs that you have: Do they run on any drive?	No, it is dependent on the Happy drive only.	Yes, it will run on any drive, they remove the protection & are able to be copied with any DOS.
7. Can you copy 20 sector or more copy guard schemes?	Yes, but it is dependent on Happy drive.	Yes, will work on any drive. e.g. Eldelon Koronis Rift.	17. How many pre-defined programs does your enhancement include?	27.	130+
8. How long does it take to deprogram these enhancements?	15 seconds.	3/4 second.	18. How many utilities does your enhancement include?	5.	10.
9. Can a utility or game be booted in your Warp Speed or Ultra Speed?	No.	Yes.	19. How much is your enhancement?	\$149 ⁹⁵	\$99 ⁹⁵
10. Do you provide an Ultra or Warp Speed DOS with your enhancement?	Yes, Top DOS. It costs \$39 ⁹⁵	No need to. Any DOS works in our Ultra Speed Mode.			

THE BACK-UP MASTER

Copy Program For All Atari Computers 800, XL & XE

ONLY

\$39⁹⁵*

For the Best Back-up Program Available

- So easy to use; works on any disk drive! Rana, Percom, Indus Trak etc.
- Turns a copyguarded original disk into an unprotected copy that will run on any Atari drive or computer! You can even send them over telephone line with your modem.

- Software upgrade revisions will be made available to registered owners for a nominal charge!
- Automatically backs up even the most difficult forms of protection weak sectors, 19 thru 34 sector & the new hardware dependent key disks!

*Plus \$3.50 for shipping and handling. Add 7% outside U.S.A. N.Y. State residents add 7½% sales tax. Dealer inquiries are welcome, call for quantity price quote.

“What’s wrong with copying software?”

“I use a lot of programs on my personal computer, and I copy them all the time.”

“I’m a programmer. Every time you copy one of my programs, you’re taking away my income—I depend on *sold* programs for a living.”

“Oh, come on. I bought it: I have a right to copy it.”

“You *do* have a right to make a back-up, that’s true. But when you start copying programs for your friends and co-workers, that’s breaking the law.”

“What law? Any copying I do is in the privacy of my own home.”

“It doesn’t make any difference where you do it. Every time you copy a program without permission from the publisher, you’re committing a federal offense.”

“That’s all right, I won’t get caught.”

“You’re missing the point. The issue isn’t “What can I get away with?”—it’s “who am I hurting?”

Remember, lots of people worked hard to produce every program you use: designers, programmers, distributors, retailers, not to mention all the people who support users. They have a *right* to be compensated for their efforts, and their major compensation is through software sales.”

“Well, I don’t mean to hurt all those people—or anyone, really.”

“Unfortunately, that’s what copying does: it hurts people. And, ultimately, it hurts people like you, who want new and innovative software.”

**Do you copy software?
Think about it.**

The unauthorized copying of software is a crime.

THE AMAZING VOICE MASTER®

ENTER
THE FINAL
FRONTIER
OF
MAN-TO-MACHINE
COMMUNICATIONS

There is nothing else like it. Voice Master gives both speech output and voice recognition with this single hardware product! Your voice controls programs, or home appliances, robots, and more with spoken commands. Verbal response back gives status, verifies, or requests your reply! Speech output and recognition patterns are recorded in with your voice. Or use the voice of your friend, boss, teacher, mother, even the family pet! Programming is simple with new commands added to BASIC. A music bonus program lets you write and compose musical scores simply by humming the tune. Unlimited applications for fun, education, and commercial use. Design your own programs for profit. Speech and recognition quality unsurpassed by even the most sophisticated machines. Only Covox provides this high-tech marvel at a price less than most common peripherals.

The Covox Voice Master comes complete with all hardware and software for only \$89.95. (Add \$4 shipping and handling for USA, \$6 Canada, \$10 overseas.) Available for Commodore 64/128, Apple II, II+, IIc, IIe, Atari 800, 800XL, 130 XE. Specify when ordering. Visa, MasterCard phone orders accepted.

\$59.95

CIRCLE 231 ON READER SERVICE CARD

Reviewed by David Plotkin

MicroCube's **MicroFlyte** joystick is an alternate controller primarily designed for use with SubLOGIC's Flight Simulator II. It has been available for a while on the eight-bit Ataris, and has recently been released in an ST version.

The MicroFlyte joystick is a box that plugs into the mouse port on the side of your ST. It contains a self-centering joystick, a reset button, the equivalent of the right and left buttons on the mouse, and two buttons for controlling the throttle (up and down). This little device makes a tremendous difference in how simple it is to fly Flight Simulator II.

To use the joystick, simply unplug the mouse from the front port of your ST and plug the joystick in. It gets its power from the computer, and a power light will come on to indicate that everything is hooked up properly. You then hold down the Reset button for a few seconds. Finally, you either press the Reset button once for "mouse" mode and

twice for "FS2" mode. In mouse mode, pushing the joystick in any direction causes the mouse pointer to travel smoothly in that direction. You can use the joystick in place of a mouse if you don't have enough desk space. "FS2" mode is the normal one you use to fly the Flight Simulator. Pressing the joystick in any direction causes the aircraft to respond appropriately: for example, pulling back on the stick will put you in a climb. The throttle buttons will advance or retard the throttle, and double as an alternate set of mousebuttons when you are in the "mouse" mode.

I can't tell you what a joy the MicroFlyte joystick is to use with Flight Simulator. The self-centering stick eliminates the wild weaving and overcorrection (causing frequent crashes) of control with the mouse. Maneuvers that would be suicide (actually, they *were* suicide!) with a mouse are easily achieved with the joystick. I successfully flew *under* both of the bridges in San Francisco Bay, buzzed the Transamerica Pyramid and landed on Alcatraz Island, all without a crash. And my first successful landing did not occur until I had switched to the joystick.

You will have to make a few minor adjustments when using the joystick. First, when you switch to the "cursor" mode of FS2, where you can set various options (maps, weather, spotter plane, etc.), you'll also want to press

the Reset button on the stick to switch to "mouse" mode, because the arrow on the screen is too difficult to control otherwise. Once you have finished setting your options, press the Reset button twice to return to "FS2" mode and resume your flight. Also, you will want to pay more attention to how your aircraft is "trimmed" for level flight. Normally, depending on your throttle setting, the aircraft will have a tendency to either dive or climb. When using the mouse, it is simple to compensate for this by setting the controls. With the self-centering joystick, though, compensating means you have to apply constant pressure to the stick, which can make turns a little tricky. However, you can easily trim the aircraft either up or down by using the keys on the numeric key pad to adjust the elevators, to the point where a centered joystick means more-or-less level flight. There are also trim tabs on the stick itself, which I have found work well for finer adjustments.

The instructions that came with the stick were preliminary and rather cryptic. I hope the production version will have better instructions included.

The MicroFlyte joystick for the Atari ST is different from the eight-bit version in a very significant way. The eight-bit version required software patches for it to work with various programs. The ST version includes its

continued on next page

own microprocessor and ROM, and can be used anywhere a mouse is. I have tried it on a variety of programs, and it works better with some than with others. For example, Starglider really works better with a mouse, although it will work with this stick.

I just love this joystick. For me it has turned using Flight Simulator II from a frustrating experience to a real pleasure. I find myself booting up whenever I have time and going for scenic rides. I can't wait until the scenery disks come out. For anyone who loves Flight Simulator but has a hard time with the mouse flight controls, this is the answer.

ARCTIC FOX

Electronic Arts
2755 Campus Drive
San Mateo, CA 94403
(415) 571-7171
\$39.95

CIRCLE 227 ON READER SERVICE CARD

Reviewed by David Plotkin

Arctic Fox from Electronic Arts is a remarkably addicting battle simulation featuring excellent graphics, animation, split-second timing and strategy to produce a superior gaming experience. You are placed at the controls of a super-tank, equipped with a high-caliber gun, guided missiles, mines, heavy armor, and a top speed of 100 mph. The mission:

penetrate the defenses of an alien enemy near the South Pole and destroy the enemy's main fortress. The hazards are many, including heavy and light tanks, rocket launchers, radar stations, two communications forts and devilishly fast fighters. The rocket launchers are especially bad news, as a single hit can so heavily damage your tank that the game is effectively over. There are natural obstacles as well: rifts (driving into one is instant death), snowfields, electrical storms that mess up your instruments, and slippery mud.

The enemy's procedure for world domination is clever: convert all our atmosphere to a poisonous gas identical to their atmosphere. To this end, oxygen converter towers are placed periodically. Destroying them delays the conversion process, and this gives you more time to find and destroy the enemy fortress. An oxygen gauge mounted on the control panel will tell you how much oxygen remains in the atmosphere. If there is none left, then you die and the game is over.

Arctic Fox is a heavily strategic game. Enemy equipment is all located within a square about 67 miles on a side. This square is bounded by a force field, and the entire game is played within this area. Fixed enemy defenses such as rocket launchers, radar, forts and oxygen converters are in the same locations each time you play. Some concentrations of firepower are too much for Arctic Fox. I recommend that you make a map of the locations of the enemy defenses. The enemy communications fort will marshal strike forces against you, so it is a good idea to knock it out, though I have won this game without doing so. But even finding the forts is tough, although mapping enemy defenses will suggest where the forts might be. . .

The graphics and sound are good. The screen shows all instruments, and the view out the window shows a high resolution, three dimensional

battlefield with rocks, mountains, ridges, rifts, snow fields, and, all too often, enemy forces. A small screen on the instrument panel shows a radar view, upon which enemy forces appear as red blips. This same screen is also the guidance system for your missiles, in effect doubling as a miniature flight simulator. The view on this small screen is from the nose camera of the missile, so accurate guidance is possible. You can even see your guided missiles and shells through your cockpit window. The animation is fairly smooth, although it does get a bit jerky when there is a lot of move-

ment on the screen. There can also be a noticeable delay before response to your input, but this really does not detract from the program.

Huge electrical storms can blot out your view and mess up your radar. During these storms, you may only see something during the flashes of lightning. This is a particularly realistic effect. Other touches include reduced speed of your tank on snow and a tendency to skid when driving on mud.

The Arctic Fox is heavily armed. Your main armament is a heavy caliber, turret-mounted cannon. It can fire rapidly, with a short time between reloads. This cannon is effective against all enemies, with multiple hits necessary on some. Your guided missiles are awesome weapons—they can take out just about anything with a single hit. They even have a radar tracking system, which won't work with all of

Midisoft Studio

MIDI editing with ease

Reviewed by Jan Moorhead

In the world of MIDI, there are lots of developers trying to sell sequencers, patch librarians, editors and every other type of music software imaginable. In this welter of hype and hoopla it's a real pleasure to find a package that does what it sets out to do, cleanly, efficiently and without a lot of fuss. If I were looking for one word to describe **MIDISOFT Studio**, it would be *clarity*. I wish every package I work with was this straight forward.

Something you become inured to when working with computers is the proliferation of bad manuals. It becomes normal to struggle with documents that are barely comprehensible. With this in mind, I was completely taken by surprise when confronted with MIDISOFT Studio's manual. They have done a splendid job in producing a clear, well-organized and well-thought-out document. It has a glossary that should be very useful to those just getting involved with MIDI systems. The table of contents, in conjunction with the glossary, make up for its only weakness, which is the lack of an index. Overall, though, it's a clean and impressive effort.

MIDISOFT Studio, as opposed to sequencers that work like drum machines, functions like a multi-track tape recorder with 32 tracks. The metaphor is carried to the *n*th degree with Fast Forward, Reverse and other tape recorder-like "buttons" on the

screen. This makes your operations very straightforward; so much so that with a little savvy, you could run this program quite easily without reading the manual at all.

You have one primary work screen, and can access everything through the usual drop-down windows. You can see 12 tracks at a time and scroll up and down through the rest of the 32 tracks. There are a generous 24 characters available for labeling the tracks. In addition to having the tracks in Play, Record or Clean modes, you can turn tracks Off or Solo them. This is very useful for editing and isolating musical problems. Solo and Off perform the same useful functions as they do on a professional mixing console. After using them a bit you will find them indispensable. A caveat: There is a small inconsistency in data entry. You can enter most numeric values with the mouse or by direct entry, but in a few cases you must key them in exclusively. In addition to the usual Desk and File menus there are three menus involved in running the program: Setup, Edit and MIDI.

The Setup window contains some very nice features. Though the program is aimed at a large general audience, some of the features nestled here make it attractive for serious professional users as well. The program will recognize or send a MIDI Song Position Pointer. This is important for synchronizing your sequencer

with other devices that have an internal clock and record song information, such as drum machines, other sequencers, and sequencer-to-tape synchronizers. The MIDI Song Position Pointer can be sent or received so that the receiving device knows its position in a composition at any point in time. This is particularly critical if you're doing work with video or film.

Another advanced feature is its control of the various MIDI modes and Local On/Off for each channel. Local On/Off disconnects your keyboard from its own internal sound generators. "Great," you say. "Just what I wanted—a function that makes it impossible to play my synth!" Ah, but what it does allow you to do is play *other* synths through MIDI while your sequencer plays the internal sound generators of your master keyboard. This and the other MIDI features allow you to make better use of the keyboards you have and lessen the need for a sophisticated mother keyboard. Personally, I've never liked the idea of spending money on something that doesn't make any noise, so I've always avoided buying a dedicated master controller. This feature gives you one of the important elements of such a controller.

The Setup also gives you control over the number of bars of count off, the meter, After-Touch filtering, the output of the MIDI clock and a few

continued on next page

special features for the advanced user. My particular favorite is "Fast Mouse," which isn't. What it really does is reduce the distance the mouse has to travel on the pad to move the cursor a particular distance on the screen. You get more done with less movement. The so-called "Expert Mode" is something that, personally, I wouldn't touch with a ten-foot MIDI cord. It removes the warning flags and windows for many of the destructive commands. I'm the kind of guy who needs to be slowed down—I'm the first one to get overconfident and blithely throw three hours of work down the toilet. I'll leave "Expert Mode" to those less breezy and more methodical individuals.

"Auto-Rewind" is a nice feature. It saves you some time when you're setting up for the next bit of recording. There is also an After-Touch Filter in the Setup window, though with a megabyte of memory on the 1040 ST (and more on the Mega STs) there is little worry about using up the available memory. If you're writing pieces that long, perhaps you should consider your audience's endurance! I can see that, occasionally, you may encounter situations where the After-Touch is controlling a feature you'd rather not use. For instance, perhaps when you are recording a track on your master keyboard the After-Touch is controlling Modulation. When the track is sent to the appropriate module, the patch you want happens to use After-Touch to control Pitch Bend. In a situation such as that you could use the After-Touch filter to remove the undesirable After-Touch information.

The Edit window has two general types of editing available: edits affecting an entire track and edits affecting portions of a track. Under the former you have Erase, Copy, Move, and Combine (often referred to as Merge in other applications). What is more interesting is the approach to area and fine point editing. They have not implemented any clever graphic representations to make life sweet for you, but they do have an effective means of achieving this all-important level of control. I've spoken to the developers,

who've assured me that they do have some interesting developments in mind for this area. Eventually, you'll be able to do editing through graphical notation. The 1040ST ought to be eminently well-suited for this approach.

The four modes of editing that you do have at this time are Insert, Delete, Paste and Erase. Erase removes information from a track but leaves a hole. Delete, however, removes the information and the resulting blank area, leaving the track shortened. Using these modes along with the Edit Mark

**When
working with
computers,
you get used to
bad manuals.
But
MIDIsoft Studio's
manual took me
completely
by surprise
—it's splendid
and
well-organized.**

windows should allow you to do any standard editing that you wish. Generally, editing with numbers isn't as much fun as being able to look at something and say "That's him! That's the bad note!" and promptly zap it. To make finding the offending error a little easier, they have created Step Play. By using the right mouse button on the screen's Play "button" you can step through part of a track one note or chord at a time. This makes the setting of Edit points a lot more intuitive and less like a lesson in business accounting.

Another feature with some nice ele-

ments that we're seeing in more sequencers nowadays is the quantization, which allows you to control not merely where notes start but their lengths as well. There are a total of four modes: no quantization, controlling note attacks, controlling note endings, or both. MIDIsoft also allows transposition of tracks or portions of tracks.

I'm not a big fan of step entry but MIDIsoft Studio's system seems to work with less hassle than most. By using one hand to select pitches on the keyboard and the other to control the parameters of the Step Entry window, you ought to be able to really fly along, with practice. The program will receive velocity information from the keyboard so this form of data entry should be more expressive than most—again, with practice.

The MIDI window allows you to do a MIDI reset, send a message to the synths for self-tuning, and send Song Selection cues for other sequencers. The handiest item is the All Notes Off command. Anyone who's spent much time working with Yamaha's DX/TX line of FM modulation synths is familiar with their special "Insta-drone" feature. It's nice to be able to fix that kind of problem without having to search through your modules to find out which one has started improvising without permission.

The people at MIDIsoft have an attitude toward product development that's very promising for future development. I have seen two releases so far, and the second is a naturally evolved and improved version. The program as it stands does not feature a lot of bells and whistles but concentrates on the basics, which are implemented intelligently. As future MIDIsoft releases offer more and more power, the program should retain its clarity and ease of use if the developers continue as they have.

continued from page 68

the enemy defenses. In those cases, you can guide the missile all the way to the target. Since you use the same joystick to steer the missile as you do to control the tank, you have to be careful not to steer into an enemy or fall into a rift while controlling the missile.

There are two modes of control, selectable with a button on the control panel. The first allows you to control the speed of the tank by pressing the joystick forward and back; the second allows you to control gun angle with the joystick. This second mode is by far the more useful! In this mode, there is another button that varies your speed and direction between full speed in the forward direction and full speed reverse. I normally stay in this second mode. Other buttons control your mines, launching of missiles, and digging into the snow to hide. The control panel will also let you know when you have been spotted, and how heavily damaged you are.

As you can tell, controlling Arctic Fox will take some practice. To help you, the buttons are laid out on the screen in the same configuration as they are on your keyboard.

Arctic Fox has several different game modes. In the practice mode, you can choose various special features, but can't win the game. An enemy preview mode presents the enemies and descriptions for you to get familiar with the game. In beginner mode, you always start out in the same place on the map. In expert mode, you can start out in different places, and enemy forces are tougher. The damage portion of this game is somewhat frustrating. There is no way to get repairs, and when a main system such as the gun or treads is damaged, there is little point in continuing the simulation. You can abort at any time, but I would have preferred to be able to beat a hasty retreat

for repairs. Another potential frustration is the delay between giving a command and the response. This is something you become used to quickly, and to be fair, a real tank certainly doesn't respond instantly!

Arctic Fox is a very realistic game/simulation with a lot of playability. It is a very welcome piece of software from Electronic Arts, a company that has not paid a lot of attention to the ST. If you enjoy action and strategy with 3-D animated graphics, you'll love Arctic Fox.

WINTER GAMES

Epyx Inc.

\$29.95-\$39.95

CIRCLE 252 ON READER SERVICE CARD

Reviewed by Rick Teverbaugh

Winter Games is exciting, colorful and great fun. The only recurring problem is that to be proficient at many of the events you must either have keen memorization skills or refer continually to the documentation.

The game has seven events you can choose to compete in, taking on as many as eight people in each. There's ski jump, bobsled, figure skating, hot dog aerials, freestyle skating, speed skating and biathlon. Some events are head-to-head, meaning that two competitors must use joysticks simultaneously.

Figure skating has eight different moves, selected by joystick or from the numeric keypad. Forward skating is necessary for the double or triple axel jumps. All others require backward skating for execution. When trying a move while skating forward, start it during an open stride. But start with closed strides on backward moves. When doing camel or sit spins, try for six rotations. Any less will hurt your score, and more will

make the skater dizzy and fall down. A perfect score is 6.0.

Freestyle skating offers the same eight moves, but points are awarded regardless of how many times each move is attempted. You choose the content of your two-minute program. Try to determine which moves you're best at and execute them as well and as often as possible.

Speed skating is controlled by rhythm, not joystick frenzy. Move the joystick left and right, in time with the leg movements of the skater. Too much quick movement can make the skater spend too much time in one spot.

Hot dog aerials is another exercise in memorization, though not as involved as the skating events. Only six moves are possible. The trick is to know which moves can be done in combination, and then time the leap so the skier lands on his feet. For those who want to get some safe points on the board before trying something more daring, a little hesitation after the jump before execut-

ing the move will increase the judges' tally.

Ski jump keeps you so busy watching the closeup box of the skier to correct flaws in form that you'll miss the smooth, precise execution of the graphics for this event. If the knees are bent too much, tap the joystick up. If the skis are crossed, tug the stick down. If the skier leans too far forward, tap the stick to the left—but be warned that too little lean cuts the length of the jump. Scoring is three

ST Product Reviews

times the distance in meters plus style points.

Biathlon is the most demanding and versatile challenge of the seven, involving uphill, downhill and cross-country skiing. Then there's a series of targets to be picked off with the .22 caliber rifle slung across the shoulder. A heart is shown pounding away at the bottom of the screen and it's a good idea not to get it pumping too fast. When the skier stops to shoot, the sights move at the same rate as the heartbeat—it wouldn't be a bad idea to stop briefly to catch a calming breath before shooting.

Bobsled shouldn't be too tough to get decent score, with a few simple guides. The first turn is a right-handed bank, and the rest of the course has a left-right, left-right pattern except for the last curve. Stay as low as possible on the curves; going too high on the bank adds to your time.

World records are saved to the first of the package's two disks. If the competition's hot, there will be a lot of disk swapping. Five points are awarded for a gold medal, three for silver and one for bronze. After the selected number of events, the highest point winner is crowned champion.

FAST—THE COMPLETE DESKTOP ORGANIZER

Migraph, Inc.

Fast is a collection of desktop accessories. They include a built-in DOS, Editor, Cardfile, Calendar, Clock, Calculator and ASCII Table. All these accessories are assembled under one entry in the Desk menu; clicking on that entry brings up a window from which you may select the tool you want by

clicking on it with the mouse or pressing the appropriate function key. The chosen accessory then appears on the screen.

ST-DOS is a resident disk operating system similar to MS-DOS. You type in commands that perform various tasks, such as formatting a disk or copying a file. Once you learn the system, this can be more efficient than using the GEM desktop. For example, to copy all the files with an extender of "DOC" from drive A to drive B, you would simply type "COPY A:*.DOC B:". This is much faster than clicking on each file in a window and dragging it to the drive icon, especially if all the files you want can't be seen in the window at once. ST-DOS allows you to set time and date, get a directory, see the contents of a file, rename a file, delete a file, and set an alarm to go off either at a certain time or in a specified number of hours and minutes from the present time. You

may also lock and unlock files, make a new directory (folder) and delete an empty directory. The formatting option supports four different formats, including two that can store more information than usual on a disk. ST-DOS also supports wildcards (characters that can substitute for a letter or a group of letters in a filename).

ST-EDIT is a full-screen editor for entering text. However, it is more like the MINCE editor than a word processor. It takes over the entire screen, so you can't enter notes while looking at other information on the screen. There is also no mouse support or menus. Instead, all commands are activated by pressing a sequence of keys. ST-EDIT supports search, replace, block moves, copies and deletes, letter transposing, and some limited macros for using in the editing sessions. The keys that activate various features seem pretty strange to me, al-

SATISFACTION GUARANTEED

though I'm told they are similar to the keys used in MINCE. Fortunately, all the commands are summarized on a card, and most of the time you can get by with just using the arrow keys, the Delete and Backspace keys, and the save file key ([Control][X]/[Control][S]). The editor does not word-wrap. Also, if you don't press [Return] at the end of every line, then the number of "physical" lines will be different from the number of "logical" lines. Some of the ST-EDIT commands use these numbers, so you need to keep track of them. You also need to keep an eye on your buffer size. If you run out of buffer for text, you must save the file, then reload it to obtain more space.

CARDFILE is an address book. It is set up in three levels. In the first level you choose the letter of the alphabet you want to work with. You may also print all the cards in the file, select one of two formats for all printing (list or label) and change the field names on the cards. Clicking on a letter of the alphabet brings you to level 2, which shows all the cards where the first field begins with the letter selected. You may edit a card, delete it, print selected cards, create a new card, or autodial one of the two phone numbers on the card. If you choose to create a new card or modify an existing one, this brings you to level 3, where you actually fill in the information on the card, save it or print it. You may also move to the next or previous card. The fields initially on the card are for names, addresses and phone numbers; you can further customize the cards by modifying a file called DEFAULT.DAT. This gives you the option of changing field length, text style (bold, underline, etc.), default buffer size, field position and various print options.

The other tools included in Fast are a digital clock, an ASCII table that shows the characters corresponding to each decimal and hex number, a four-function calculator with mem-

ory and percent that allows you to enter either by clicking on a button or pressing a key on the keyboard, and a calendar that displays one month at a time. To step through the months and years you use the arrow keys. The calendar doesn't remind you about what the key functions are, so I frequently found myself pressing the wrong arrow keys. You cannot access any date before 1980, and stepping through the years to 50 years in the future can take a while—one year at a time.

The documentation accompanying Fast has a number of inaccuracies and typos. In several places, the picture of a screen or dialog box doesn't match the description, text is missing on another page, and some paragraphs make absolutely no sense at all. The distinction between physical and logical lines in the editor is never made, and the ST-DOS section assumes you know quite a bit about MS-DOS. Mi-graph claims that most people never read the documentation for a program this simple. That may normally be true, but I'd like to see someone figure out ST-EDIT without a manual. At any rate, you can figure everything out—it just takes longer.

I have mixed feelings about Fast. As with other combination desk accessories, I find that I like some of the tools (like ST-DOS), and don't want to give up the memory for others (like ST-EDIT). Whether this package is right for you will depend on what you need.

BUZZWORD

CIRCLE 228 ON READER SERVICE CARD

Reviewed by Sol Guber

Buzzword is a word-guessing game

with a sophisticated strategy, suitable for both adults and children because of its multi-level play. Buzzword uses a subtle sense of humor to give clues for each set of words. The words are combined in categories and the package contains a set of cards with all the answers in the categories.

The game is quite simple to play. The upper right section of the screen contains the nine boxes that stand for the words you will be guessing. At the simplest level, each box will contain the first letter of the word and how many letters make up the word. At the bottom of the screen is a list of all the letters used in the nine words, as well as their frequency of usage. Also at the bottom of the screen is a typewriter, where you type your answers. In the upper right corner is the score. As you guess each word correctly, the number of letters available is decreased.

Before we go any further, let me give some examples of both the type of words that need to be guessed and the variety of categories. Let's pick a category at random: "A MAN'S CASTLE." Now try to guess three words: a six-letter word starting with D, a six-letter word starting with S, and a six-letter word starting with W. If you figured out that the words are duplex, shanty, and wigwam, your word reasoning is excellent. Let's try another category called "NO NUTRITION"—things people put in their mouths. The words you need to guess each have four letters, and start with a "C," an "F," and a "P." If you guessed chaw, foot and pipe, then this is the game for you.

The object of the game is to guess the word and type it correctly. You are scored on the number of words you have previously guessed correctly, and the column and row of the word. If you make five mistakes, or determine all the words correctly, your turn is over. There are 200 different categories and between 30 and 50 members in each category, so it is very difficult to remember all

ST New Products

By GREGG PEARLMAN, ANTIC ASSISTANT EDITOR

of the answers in any one category.

It's evident much time and effort went into making this game. The contents of the sets of words are of various difficulty, with something for everyone. The categories included range from Old MacDonald's Farm to Opera, and from the Zodiac to Golf. There is only one screen in the game, but the colors are bright and the "typewriter" action is good. There is only a slight amount of animation, and few sounds (when you press the keys and when you identify the words correctly), but the game doesn't require more bells and whistles for enjoyable play.

While not billing
itself as such,
Buzzword is quite
educational and is
lots of fun to play.

You have numerous options available when you play Buzzword. You can play it by yourself, against another player, or with groups of people. Using the various options, some of this information will not be available—for example the first letter of the word and its length can be hidden or displayed. Finally, you can set a timer to make the game a real challenge.

While not billing itself as an educational game, Buzzword is quite educational. It is also lots of fun to play in groups and is as sophisticated as some trivia games. The package comes with cards that contain all of the categories and the answers. The 24-page manual explains the variations well, and gives a list of the various subjects. This game is like no other, and it's a well-designed word game for the whole family. 

TWO MORE FROM MICHTRON

Print any text file, from program listings to online user manuals to BBS data, with **Mi-Print** (\$29.95). Mi-Print gives you command over paper size, margins, headers, page numbers, pitch and line numbers, and it remembers the control codes and automatically sets up the printer to use the selected modes. Mi-Print can also be used as a typewriter, so you don't need to use a word processor for small jobs like addressing envelopes or writing short letters. Mi-Print can also list every file on a disk, including those in subfolders.

Your Financial Future (\$39.95) gives you more control over your money matters. You can find where your finances stand and what direction they're taking, and determine the long-term effects of inflation on your current balance and the potential income you might receive on interest-bearing investments.

MichTron, 576 South Telegraph, Pontiac, MI 48053. (313) 334-5700. PRESS.

FIT FOR A KING

Royal Software's **EZ Calc** (\$69.95) is a fully mouse-controlled, GEM-based spreadsheet featuring 300 columns by 999 rows, a built-in sort routine, online help windows and 10 macros controlled by the function keys. But its most interesting feature is a 10-key calculator that can be pulled down any time and operated either with mouse or keyboard—and the results of a calculation can be transferred to any cell with the click of the mouse. EZ Calc even lets you attach a four-line personal note to any cell, which is then highlighted to remind you about the note.

Help Calc (\$24.95) contains 11 preprogrammed templates, including check register, depreciation schedules, investment portfolio and loan amortization schedules for EZ Calc or VIP Professional.

New ST product notices are compiled from information provided by the products' manufacturers. Antic assumes no responsibility for the accuracy of these notices or the performance of the product. Each mention is followed by a code word indicating that, at press time, Antic had seen a FINAL marketable version, near-final BETA, earlier ALPHA, incomplete DEMO, or PRESS release. 

TYPING SPECIAL ATARI CHARACTERS

Antic printed program listings leave a small space between each Atari Special Character for easier reading. Immediately below you will see the way Antic prints all the standard Atari letters and numbers, in upper and lower case, in normal and inverse video.

```

ABCDEF GHI JKLMNOPQRSTU VWXYZ
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9
  
```

The Atari Special Characters and the keys you must type in order to get them are shown in the two boxes below.

NORMAL VIDEO				INVERSE VIDEO			
FOR THIS	TYPE THIS	FOR THIS	TYPE THIS	FOR THIS	TYPE THIS	FOR THIS	TYPE THIS
CTRL ,	CTRL S	CTRL A	CTRL T	CTRL ,	CTRL X	CTRL X	CTRL X
CTRL B	CTRL U	CTRL B	CTRL U	CTRL A	CTRL Y	CTRL Y	CTRL Y
CTRL C	CTRL V	CTRL C	CTRL V	CTRL B	CTRL Z	CTRL Z	CTRL Z
CTRL D	CTRL W	CTRL D	CTRL W	CTRL C	ESC	ESC	SHIFT
CTRL E	CTRL X	CTRL E	CTRL X	CTRL D	SHIFT DELETE	ESC	SHIFT DELETE
CTRL F	CTRL Y	CTRL E	CTRL Y	CTRL F	ESC SHIFT INSERT	ESC	SHIFT INSERT
CTRL G	CTRL Z	CTRL F	CTRL Z	CTRL G	ESC CTRL TAB	ESC	CTRL TAB
CTRL H	ESC ESC	CTRL G	ESC ESC	CTRL H	ESC SHIFT TAB	ESC	SHIFT TAB
CTRL I	ESC CTRL -	CTRL I	ESC CTRL -	CTRL J	ESC CTRL .	CTRL .	CTRL .
CTRL J	ESC CTRL =	CTRL K	ESC CTRL =	CTRL K	ESC CTRL ;	CTRL ;	CTRL ;
CTRL K	ESC CTRL +	CTRL L	ESC CTRL +	CTRL L	ESC CTRL =	CTRL =	CTRL =
CTRL L	CTRL .	CTRL M	CTRL .	CTRL M	ESC CTRL *	CTRL *	ESC CTRL *
CTRL M	CTRL ;	CTRL N	CTRL ;	CTRL N	ESC CTRL =	CTRL =	ESC CTRL =
CTRL N	ESC CTRL =	CTRL O	ESC CTRL =	CTRL O	ESC SHIFT CLEAR	CTRL =	ESC SHIFT CLEAR
CTRL O	ESC DELETE	CTRL P	ESC DELETE	CTRL P	ESC TAB	CTRL =	ESC DELETE
CTRL P	ESC TAB	CTRL Q	ESC TAB	CTRL Q		CTRL =	ESC CTRL INSERT
CTRL R		CTRL R		CTRL R		CTRL =	ESC CTRL INSERT
		CTRL S		CTRL S		CTRL =	
		CTRL T		CTRL T		CTRL =	
		CTRL U		CTRL U		CTRL =	
		CTRL V		CTRL V		CTRL =	
		CTRL W		CTRL W		CTRL =	

Whenever the CONTROL key (CTRL on the 400/800) or SHIFT key is used, *hold it down* while you press the next key. Whenever the ESC key is pressed, *release* it before you type the next key.

Turn on inverse video by pressing the Reverse Video Mode Key . Turn it off by pressing it a second time. (On the 400/800, use the Atari Logo Key instead.)

Among the most common program typing mistakes are switching certain capital letters with their lower-case counterparts—you need to look especially carefully at P, X, O and 0 (zero).

Some of Atari Special Characters are not easy to tell apart from standard alpha-numeric characters. Usually the Special Characters will be boxed. Compare the two sets of characters below:

SPECIAL		STANDARD	
	CTRL F		/
	CTRL G		SHIFT +
	CTRL N		SHIFT -
	CTRL R		-
	CTRL S		+

HOW TO USE TYPO II80

DISK SUBSCRIBERS: Programs for 8-bit Atari computers can be used immediately. Just follow instructions in the accompanying magazine articles. ST Owners: See monthly disk's ST Help File for instructions on how to transfer programs to 3-1/2 inch disk.

DOS COMPATIBILITY: All 8-bit programs published by Antic are tested to work with Atari Disk Operating System (DOS) 2.0S and 2.5—not with the incompatible DOS 3.0. DOS 2.0S is available on each Antic Monthly Disk. Copy the DOS.SYS and DUP.SYS files.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise, without the prior written permission of the publisher.

HOW TO USE TYPO II (8-BIT)

TYPO II automatically proofreads *Antic's* type-in BASIC listings for 8-bit Atari computers. It finds the exact line where you made a program typing mistake.

Type in TYPO II and SAVE a copy to disk or cassette. Now type GOTO 32000. When you see the instruction on the screen, type in a single program line **without the two-letter TYPO II code** at the left of the line number. Press the [RETURN] key.

Your line will reappear at the bottom of the screen with a two-letter TYPO II code on the left. If this code is not exactly the same as the line code printed in the magazine, you mistyped something in that line.

To call back any line previously typed, type an asterisk [*] followed (without in-between spaces) by the line number, then press [RETURN]. When the complete line appears at the top of the screen, press [RETURN] again. This is also the way you use TYPO II to proofread itself.

To LIST your program, press [BREAK] and type LIST. To return to TYPO II, type GOTO 32000.

To remove TYPO II from your program, type LIST "D:FILENAME",0,31999 [RETURN] (Cassette owners LIST "C:"). Type NEW, then ENTER "D:FILENAME"[RETURN](Cassette—ENTER "C:"). Your program is now in memory without TYPO II and you can SAVE or LIST it to disk or cassette.

Don't type the
TYPO II Codes!

CARDIAC ARREST!

resuscitation simulator
for XL/XE or ST

\$69

includes medical manual

The patient just died. Are you good enough to "bring him back?" In "Cardiac Arrest!" you interpret EKG's, history, vital signs, and lab data while you order drugs and procedures for your patient. There's nothing else to compare to this simulator at any price.

Our other medical software teaches ACLS concepts, from basic knowledge (CardioQuiz) to fancy lab analysis (Blood Gases) to rhythm strip interpretation (EKG Teaching) to cardiac treatment algorithms (Protocol Learning). Updates, \$6.

Compatibility.

It's All In The Connection.

com-pat-i-bil-i-ty (kəm pat'ə bil'i tē)

n. 1. capable of living together harmoniously or getting along well together.

Sounds more like the kind of relationship shared between best friends rather than between Atari 8-bit computers and non-Atari peripherals, *doesn't it?*

Not anymore.

Not since we've defined peripheral compatibility for the Atari XL/XE systems.

It's about time you were able to choose a printer or MODEM because it possessed the special features needed to enhance your system's performance. *Right?*

And isn't it about time your selection was not just limited to only a handful of peripherals boasting 'Atari Compatibility' as their most impactful benefit?

Now, the time has come to change your peripheral habits . . . *for the better*. Our compatible connections give you choices you've never had before, bridging the gap between the hundreds of printers and MODEMs available today and the Atari 8-bit world.

The P:R:Connection is packed full of surprises . . . a standard 'centronics' parallel printer port plus, not one but two serial/MODEM ports! The serial ports resemble that of the Atari 850 interface, possessing all the same signals and functions while using a fully compatible R:handler. Simply plug it into the serial port of your Atari 8-bit and suddenly the power of compatibility enables you to explore new and exciting dimensions in today's printer and MODEM resources.

Our Printer Connection does just what its

name implies . . . supplies a compatible connection between your Atari 8-bit and the standard 'centronics' parallel printer of your choice!

Either way you look at it, both connections have clearly defined "*compatibility*" for the Atari 8-bit user. Finally, peripheral choice is yours at last. Now, only the hard part is left up to you . . . *making up your mind!*

STIMULATION

FROM THE WORLD'S LARGEST ST PUBLISHER

STupendous!

Karate Kid Part II

Guide Daniel through fight after fight against ever more powerful adversaries. Then face the evil Chozen himself in the Castle of King Shohashi, where you must discover the secret of the drum - or die! But the fighting isn't all: Catch flies with chopsticks and break ice with your bare hand in full-color, animated graphic sequences. Daniel LaRusso faced the challenge and became a hero. What will you do?

Color only. **\$39.95**

STaggering!

Shuttle II

It's the 1990's and this new Shuttle can take off and fly with the minimum of controls. Decide the launch and landing details then take the seat of Flight Commander for liftoff. Find a faulty Satellite and go out with your jet pack and haul it in. Then return to Earth. Can you keep from burning up? Can you land without crashing? Find out now in this fantastic simulation!

Color only. **\$39.95**

STunning

Pinball Factory

Play great pinball and even design your own screens. Place tabs, bumpers, and ball traps to get the action just right, then use the powerful drawing system to put in the walls. Add flair with a graphic logo. You can even set the scoring, gravity, speed and elasticity! Play the best pinball game you can imagine! There are even tilt controls to let you "bump" the machine!

Color only. **\$39.95**

STriking!

Eight Ball

The poolhall favorite is here! Realistic graphics and ingeniously simple mouse control make this one a sure bet.

Color or Monochrome. **\$29.95**

Trivia Challenge

Nearly 4000 questions on International Sport, The Arts, Pop Music, Science and General knowledge. Arcade style play keeps the game quick. You can even put in your own questions!

Color or Monochrome. **\$39.95**
